Contents

1. Introduction 1
1.1 Chaotic Dynamics 2
1.2 Noise-Induced Complex Patterns 4
1.3 Chaos and Self-Organization 6

2. Unpredictable Dynamics 9
2.1 Hamiltonian Systems 9
2.2 Destruction of Tori 16
2.3 Ergodicity and Mixing 21

3. Strange Attractors 29
3.1 Dissipative Systems and Their Attractors 29
3.2 The Lorenz Model 35
3.3 Lyapunov Exponents 41
3.4 The Autocorrelation Function 45

4. Fractals 50
4.1 Self-Similar Patterns 50
4.2 Dimensions 54
4.3 Fractal Dimensions of Strange Attractors 56

5. Discrete Maps 60
5.1 Fixed Points and Cycles 60
5.2 Chaotic Maps 65
5.3 Feigenbaum Universality 68

6. Routes to Temporal Chaos 73
6.1 Bifurcations 73
6.2 The Ruelle-Takens Scenario 75
6.3 Period Doubling 78
6.4 Intermittency 80

7. Spatio-Temporal Chaos 85
7.1 Embedding Dimensions 85

7.2 Phase Turbulence 91
7.3 Coupled Chaotic Maps 95

8. Random Processes 106
8.1 Probabilistic Automata 106
8.2 Continuous Random Processes 111
8.3 The Fokker-Planck Equation 117

9. Active Systems with Noise 120
9.1 Generalized Brownian Motion 120
9.2 Internal Noise 126
9.3 Optimal Fluctuations 132

10. Population Explosions 138
10.1 Mean Ignition Time of Explosion 138
10.2 Intermittency of Growth 142
10.3 Breeding Centers 149

11. Extinction and Long-Time Relaxation 153
11.1 Random Traps 153
11.2 Irreversible Annihilation 156
11.3 Conserved Quantities and Long-Time Relaxation 162
11.4 Stochastic Segregation and the Sub-Poissonian Distribution 165

12. Catastrophes 170
12.1 Second-Order Phase Transitions 171
12.2 Sweeping Through the Critical Region 176
12.3 The Biased Transition 180
12.4 Population Settling-Down 186
12.5 Survival in the Fluctuating Environment 192
