CONTENTS

FOREWORD ix

PREFACE TO THE SECOND EDITION xi

TRANSLATION EDITOR'S NOTE xii

I. PROPERTIES OF MANY-PARTICLE SYSTEMS AT LOW TEMPERATURES

§ 1. Elementary excitations. Energy spectrum and properties of liquid He^4 at low temperatures 1
1. Introduction. Quasi-particles 1
2. Spectrum of a Bose liquid 5
3. Superfluidity 10

§ 2. Fermi liquids 15
1. Excitations in Fermi liquids 15
2. Quasi-particle energy 18
3. Sound 22

§ 3. Second quantisation 27

§ 4. Dilute Bose gas 30

§ 5. Dilute Fermi gas 35

II. QUANTUM FIELD THEORETICAL METHODS AT $T = 0$

§ 6. The interaction representation 42

§ 7. The Green function 49
1. Definition. Free particle Green functions 49
2. Analytic properties 53
3. Physical meaning of the poles 57
4. Green function of a system in an external field 61

§ 8. Basic principles of diagram techniques 63
1. Transformation from N to μ as independent variable 63
2. Wick's theorem 64
3. Feynman diagrams 66

§ 9. Rules for drawing diagrams for different types of interaction 70
1. The diagram technique in coordinate space. Examples 70
2. The diagram technique in momentum space. Examples 78

§ 10. Dyson equation. The vertex part. Many-particle Green functions 83

1. Diagram summation. Dyson equation 83
2. Vertex parts. Many-particle Green functions 87
3. Ground state energy 93

III. The Diagram Technique at Finite Temperatures

§ 11. Temperature-dependent Green functions 95
1. General properties 95
2. Temperature-dependent free particle Green functions 99
§ 12. Perturbation theory 101
1. The interaction representation 101
2. Wick's theorem 104
§ 13. The diagram technique in coordinate space. Examples 109
§ 14. The diagram technique in momentum space 118
1. Transformation to the momentum representation 118
2. Examples 121
§ 15. The perturbation theory series for the thermodynamic potential 128
§ 16. Dyson equation. Many-particle Green functions 132
1. Dyson equation 132
2. Connection between the Green functions and the thermodynamic potential Ω 137
§ 17. Time-dependent Green functions G at finite temperatures. Analytic properties of the Green functions 141

IV. Fermi Liquid Theory

§ 18. Properties of the vertex part for small momentum transfer. Zero sound 152
§ 19. Effective mass. Connection between Fermi momentum and number of particles. Bose branches of the spectrum. Specific heat 158
1. Auxiliary relations 158
2. Proof of the fundamental relations of the Fermi liquid theory 160
3. Bose branches of spectrum 162
4. Another derivation of the connection between the Fermi momentum p_0 and the number of particles 164
5. Specific heat 166
6. Damping of quasi-particles in a Fermi liquid 170
§ 20. Special properties of the vertex part in the case where the total momentum of the colliding particles is small 173
§ 21. Electron-phonon interactions 177
1. The vertex part 177
2. The phonon Green function 179

3. The electron Green function 182
4. A correction to the linear term in the electronic specific heat 188
§ 22. Some properties of a degenerate plasma 189
1. Statement of the problem 189
2. Vertex part for small momentum transfer 191
3. The electron spectrum 195
4. Thermodynamic functions 200

V. System of Interacting Bosons

§ 23. Application of field theory methods to a system of bosons at absolute zero 203
§ 24. Green functions 212
1. Structure of the equations 212
2. Analytic properties of the Green functions 216
3. Behaviour of the Green functions for small momenta 219
§ 25. Dilute non-ideal Bose gas 220
1. Diagram technique 220
2. Connection between the chemical potential and the self-energy parts of the single-particle Green functions 223
3. Low density approximation 226
4. Effective interaction potential 229
5. Green functions of a Bose gas in the low density approximation. Spectrum 232
§ 26. Properties of the single-particle excitation spectrum close to its end-point 233
1. Statement of the problem 233
2. System of equations 235
3. Properties of the spectrum close to the phonon creation threshold 237
4. Properties of the spectrum close to the threshold of break-up into two excitations with parallel non-vanishing momenta 241
5. Break-up into two excitations at an angle to each other 242
§ 27. Application of field theory methods to a system of interacting bosons at finite temperatures 245

VI. Electromagnetic Radiation in an Absorbing Medium

§ 28. Radiation Green functions in an absorbing medium 250
§ 29. Calculation of the dielectric constant 257
§ 30. Van der Waals forces in a non-uniform dielectric 261
§ 31. Molecular interaction forces between solids 266
1. Interaction forces between solids 266

2. Interaction forces between atoms in solutions 272
3. Thin films on a solid surface 275

VII. Theory of Superconductivity

§ 32. General introduction. Choice of model 277
1. Superconductivity 277
2. Model. Interaction Hamiltonian 279

§ 33. Cooper phenomenon. Instability of the ground state of a system of non-interacting fermions with respect to arbitrarily weak attractions between the particles 281
1. Equation for the vertex part 281
2. Properties of the vertex part 284
3. Determination of the transition temperature 286

§ 34. System of fundamental equations for a superconductor 288
1. Superconductor at absolute zero 288
2. The equations in the presence of an external electromagnetic field. Gauge invariance 293
3. Superconductor at finite temperatures 294

§ 35. Deduction of the superconductivity equations in the phonon model 296

§ 36. Thermodynamics of superconductors 300
1. Temperature-dependence of the gap 300
2. Specific heat 302
3. Critical field 304

§ 37. Superconductors in a weak electromagnetic field 305
1. Constant weak magnetic field 305
2. Superconductor in variable fields 312

§ 38. Properties of superconductors closeto the transition temperature in an arbitrary magnetic field 317

§ 39. Theory of superconducting alloys 322
1. Statement of the problem 322
2. Residual resistance of normal metals 323
3. Electromagnetic properties of superconducting alloys 330

VIII. Transport Equation for Excitations in a Fermi Liquid

§ 40. Non-equilibrium properties of a Fermi liquid 339
1. Introduction 339
2. Statement of the problem 341

§ 41. The analytical properties of the vertex part 342

§ 42. Equation for the vertex part; transport equation 348
