

CONTENTS

I.	<i>Geomagnetism and Related Phenomena</i>	3
1.1	Historical	3
1.2	The external field of a uniformly magnetized sphere	7
1.3	The magnetic field at the earth's surface	10
1.3a	Isomagnetic charts	11
1.3b	The magnetic potential and the dipole field	12
1.3c	The origin and secular variation of the field	13
1.4	The magnetic field above the earth's surface	13
1.5	Electric currents in and beyond the ionosphere	14
1.5a	The Sq electric current system	15
1.5b	The electrical conductivity in the ionosphere	16
1.5c	Solar flares, short-wave radio fadeouts and the Sq currents	19
1.6	The polar current system DP	20
1.7	The sudden commencement current DCF	24
1.8	The ring current DR and its field	24
1.9	Local and world indices of geomagnetic disturbance	24
1.10	The solar rotation	27
1.11	Measures of solar activity	28
1.12	Sunspot latitudes and magnetism	28
1.13	The 27-day recurrence tendency in geomagnetic disturbance	29
1.13a	Interpretation of the recurrence tendency in geomagnetic disturbance	31
II.	<i>The Solar Plasma on its Way to the Earth</i>	32
2.1	The path of a solar particle	32
2.1a	Special case: no radial force	34
2.1b	Special case: the Milne Doppler force	34
2.2	Continuous emission from P; the "stream"-curve	35
2.3	Numerical illustrations, for constant radial speed	36
2.4	Emission within a conical solid angle	39
2.5	Transported solar magnetic fields and cosmic rays	39
2.6	Attempts to find the radial speed by the superposed epoch method	39
2.7	The lateral expansion of a stream in transit from a point source	40
2.8	The lateral expansion of a stream in transit from an emitting area	42
2.9	Emission from non-equatorial areas on the sun	43
2.10	The nature of the onset of a stream-produced magnetic storm	45
2.11	The shell of solar gas emitted from a solar flare	45

2.12	Retardation on the way from the sun	47
2.13	Plasma kinetic density and magnetic field energy	48
2.14	The electrical discharge theory of solar streams	49
III. The Mutual Influence of the Solar Gas and the Geomagnetic Field		51
3.1	Neutral ionized solar gas (or plasma)	51
3.2	The interaction between a thin plane conductor and the dipole field	52
3.3	The cylindrical sheet plasma problem	57
3.4	The case of unseparated sheets	59
3.5	Radial projection: sheets unseparated	61
3.5a	Equal oblique projection: sheets unseparated	61
3.6	The case $n = 3$	62
3.7	Energy transformation: radial projection from infinity without separation	69
3.8	Oblique projection from infinity	71
3.9	The impact of a plane-faced volume stream upon a plane-stratified field	74
3.10	Instabilities	78
3.11	The steady-state form of the hollow in the stream	78
3.12	Exact solutions of related problems: two-dimensional cases	81
3.13	Somewhat analogous axially symmetrical three-dimensional problems	84
3.14	The hollow round a point dipole: approximate calculations	86
3.14a	The hollow at the equinoxes ($\lambda = 0$)	88
3.14b	Oblique incidence of the solar plasma	93
IV. Magnetic Disturbance and Aurora		95
4.1	The parts M,S,L,D, of the geomagnetic field	95
4.2	The morphology of the D Field	97
4.3	Some auroral features	106
V. The Ring Current and its DR Field		108
5.1	Störmer's hypothesis concerning the DR field	108
5.2	Schmidt's ring current	108
5.3	The Chapman-Ferraro ring current	109
5.4	Singer's model ring current	109
5.5	The equation of motion of a charged particle	110
5.5a	Larmorian motion: B uniform and constant, $F = 0$	110
5.5b	Modified Larmorian motion: B uniform and constant, F constant	112
5.5c	Motion in a constant non-uniform magnetic field	112
5.6	The drift motion	114
5.7	The drift current; B non-uniform and constant; $F = 0$	114

5.8	Diamagnetism and the equivalent electric current	115
5.9	The total plasma current intensity i	115
5.10	The pitch angle and density distributions	116
5.11	The motion of the charges in a constant dipole field, $F = 0$	117
5.12	Model calculations of the DR current and field	123
