<i>Preface and Acknowledgments</i>	ix
<i>Prologue</i>	i
1 The invention of Dr. Spitzer Juan Peron's 1951 blunder. The secret Matterhorn Project at Princeton. Growing pains on the Stellarator.	16
2 Behind closed doors Igor Kurchatov's revelation. The design of Andrei Sakharov. ZETA's public relations debacle.	33
3 Friends and rivals 1958: The freedom of declassification. Competition in Geneva. Forging the international fraternity.	54
4 Searching for answers Lev Artsimovich attacks the mirror machine. Problems on the C-Stellarator. Harold Furth's "Balloon to the Moon" paper. Lyman Spitzer quits.	66
5 Dawn of the tokamak A Soviet claim of success on the T-3. Britain's laser measuring team goes to Moscow. Princeton constructs a tokamak.	82
6 Building big science The AEC consolidates control under Robert Hirsch. Pressure for deuterium-tritium fuels. The United States plans a second-generation tokamak.	98
	vii

Contents

7	Forming the major league Japan cautiously enters the race. Politics delays a joint European tokamak. 1977: JET is approved.	110
8	The political plasma Theoretical stumbling blocks. 1982: TFTR's race to "first plasma".	126
9	The modern fusion lab The avalanche of data. Sakharov's exile strains cooperation.	143
10	The plasma olympics "The Beam Team" on patrol. An appeal for insight.	161
11	Different directions Laser fusion at Livermore lab. The weapons link. Edward Teller advocates a fusion-fission hybrid. The role of radioactivity.	170
12	Struggling to sell fusion 1983: Lawrence Lidsky's loud dissent. Fusion's friends: Bob Guccione, Lyndon LaRouche, Ansel Adams.	188
13	In sight of breakeven 1986: "supershots" arrive. Plans for an international reactor.	213
14	Fusion's past and future 1989: Utah's "cold fusion" fiasco. Lyman Spitzer and Paul- Henri Rebut look ahead.	228
	Notes	241
	Glossary	245
	Appendix A: Basic physics of fusion	255
	Appendix B: Fusion devices	258
