Preface	v
Introduction	1
Chapter 1. Motion of a charged particle in an electromagnetic field	5
1.1. Introduction	5
1.2. Hamiltonian Mechanics. Canonical and pseudo-canonical transformations	7
1.3 Magnetic field and magnetic field lines. Intrinsic local reference frame	16
1.4. Equations of motion of a charged particle in an inhomogeneous stationary electro- magnetic field. Particle variables	24
1.5. Motion of a charged particle in simple electromagnetic fields	30
1.6. The drift approximation: The method of the average	39
1.7. The drift approximation: The averaging pseudo-canonical transformation. I. Sta- tionary, homogeneous fields	50
1.8. The drift approximation: The averaging pseudo-canonical transformation. II. Stationary, spatially inhomogeneous fields	58
1.9. The drift approximation: The averaging pseudo-canonical transformation. III. Slowly time-dependent, inhomogeneous fields	69
References	76
Chapter 2. The microscopic description of a plasma	79
2.1. Statistical description of a plasma	79
2.2. Liouville equation for independent particles in stationary external fields	84
2.3. Liouville equation for independent particles in time-dependent external fields	91
2.4. The BBGKY equations and the kinetic equation for interacting charged particles ..	98
2.5. The Vlasov kinetic equation	104
2.6. The Landau kinetic equation	107
2.7. Conservation properties of the collision term	114
2.8. The “Lorentz process”	118
Appendix 2A.1. Derivation of the collision term	123
References	130
Chapter 3. The macroscopic description of a plasma	133
3.1. Local distribution functions	133
3.2. Macroscopic quantities of a plasma	136
3.3. Kinetic equation revisited	144
3.4. Equations of evolution of the macroscopic quantities	146
3.5. The entropy balance	155
References	161

Chapter 4. The Hermitian moment representation	163
4.1. Characteristic time scales. The quasi-neutrality approximation	163
4.2. The local plasma equilibrium state	167
4.3. The Hermitian moment expansion	170
4.4. Classification of the moments	177
4.5. Equations of evolution for the moments. I. General form	181
4.6. Equations of evolution for the moments. II. The generalized frictions	190
Appendix 4A.1. Derivation of the moment equations	202
Appendix 4A.2. Proof of the results of table 6.1	205
Appendix 4A.3. Collisional contributions to the moment equations	207
References	209
Chapter 5. The classical transport theory	211
5.1. The linear transport regime	211
5.2. Solution of the linearized moment equations. Asymptotics and Markovianization. Moment description and thermodynamics	217
5.3. The classical transport coefficients	228
5.4. Numerical values of the transport coefficients. Convergence of the approximation scheme	235
5.5. Discussion of the transport equations	243
5.6. Limiting values of the transport coefficients in a very strong magnetic field	258
5.7. Comparison with other treatments	264
References	275
Chapter 6. Entropy and transport	277
6.1. Entropy balance and <i>H</i> -Theorem	277
6.2. Entropy and Hermitian moments. The kinetic form of the entropy production	281
6.3. The thermodynamic form of the entropy production	286
6.4. The transport form of the entropy production	288
References	293
Chapter 7. Magnetohydrodynamics	295
7.1. The classical hydrodynamical equations. Dissipative magnetohydrodynamics	295
7.2. Resistive magnetohydrodynamics	299
7.3. Ideal magnetohydrodynamics	305
7.4. Magnetohydrodynamics, astrophysics and fusion. The strategy of fusion theory	311
References	315
General appendix G1. Basis functions in velocity space	317
G1.1. Expansions around the reference distribution function	317
G1.2. Reducible tensorial Hermite polynomials	318
G1.3. Spherical harmonics, Laguerre-Sonine polynomials, Burnett functions	320
G1.4. Irreducible tensorial Hermite polynomials	325
References	330

Author index	xvii
Subject index	xxiii
Index of notations	xxix
