|                                                                                                                                   |     |
|-----------------------------------------------------------------------------------------------------------------------------------|-----|
| <i>Preface</i>                                                                                                                    | ix  |
| <b>1 Introduction</b>                                                                                                             | 1   |
| <b>2 The multi-beam laser system KAL'MAR and its diagnostics</b>                                                                  | 15  |
| 2.1 Characteristics of the powerful nine-beam laser system                                                                        | 15  |
| 2.2 The KAL'MAR oscillator                                                                                                        | 18  |
| 2.3 The spectrum of the heating radiation                                                                                         | 19  |
| 2.4 Diagnostics of the brightness and energy characteristics of the laser and its optimisation                                    | 21  |
| 2.5 The diagnostic system for non-steady plasmas                                                                                  | 28  |
| <b>3 Optical diagnostics of the inhomogeneous corona of a plasma</b>                                                              | 31  |
| 3.1 Specific features of optical probing of a highly inhomogeneous plasma                                                         | 32  |
| 3.2 The required parameters of the probing radiation                                                                              | 36  |
| 3.3 Sources of the probing radiation                                                                                              | 39  |
| 3.4 Types of interferometer                                                                                                       | 47  |
| 3.5 Methods of numerically processing the interferograms                                                                          | 56  |
| 3.6 Study of the motion of the $n_c$ and $n_c/4$ density regions                                                                  | 67  |
| <b>4 Investigation of strong shock waves by active optical diagnostics</b>                                                        | 71  |
| 4.1 Diagnostics for spherical shock waves arising in the background gas                                                           | 72  |
| 4.2 General properties of the image formed when probing ionising shock waves                                                      | 74  |
| 4.3 Specific feature of the use of optical methods in the investigation of ionising shock waves: processing the experimental data | 81  |
| 4.4 A comparison of the results of the various optical methods used to diagnose a shock wave                                      | 86  |
| <b>5 Methods for diagnosing the particle emission from laser-produced plasmas</b>                                                 | 89  |
| 5.1 Specific feature of the measurement of the ion energy spectrum from an inertially confined plasma                             | 90  |
| 5.2 Time-of-flight collector measurements                                                                                         | 93  |
| 5.3 Types of mass spectrometer                                                                                                    | 97  |
| 5.4 Thomson mass spectrographs                                                                                                    | 103 |
|                                                                                                                                   | v   |

|                                                                                                                                                                        |     |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| <b>6 Investigation of the X-ray continuum emission from the plasma</b>                                                                                                 | 111 |
| 6.1 The methods of measuring the spectral distribution of the X-ray continuum                                                                                          | 112 |
| 6.2 X-ray detectors and their application                                                                                                                              | 114 |
| 6.3 Determining the spectrum of the X-ray continuum                                                                                                                    | 122 |
| 6.4 X-ray imaging techniques for the self-emission from the plasmas                                                                                                    | 127 |
| 6.5 Mathematical processing of the X-ray pin-hole camera images                                                                                                        | 133 |
| <b>7 Structure and dynamics of shock waves established during the plasma expansion in the background gas</b>                                                           | 137 |
| 7.1 General properties of shock waves generated by an expanding plasma                                                                                                 | 137 |
| 7.2 The effect of electron thermal conductivity on the structure of the shock wave: determining the velocity of the shock wave from the width of the pre-heated region | 142 |
| 7.3 The initial stage of motion of the shock wave. Determination of the plasma temperature and the evaporated mass of the target                                       | 146 |
| 7.4 Dynamics of an ionising shock wave during adiabatic expansion of the gas                                                                                           | 150 |
| 7.5 Measurement of the energy in the shock wave                                                                                                                        | 159 |
| <b>8 The energy balance for spherically irradiated targets: diagnostics and its investigation</b>                                                                      | 162 |
| 8.1 Calorimetry in investigation of the energy balance                                                                                                                 | 162 |
| 8.2 Other methods of measuring the energy balance                                                                                                                      | 167 |
| 8.3 Determining the energy absorbed by the plasma from the dynamics of the shock wave                                                                                  | 169 |
| 8.4 Specific limitations on methods of measuring the energy balance                                                                                                    | 174 |
| 8.5 Studies of the energy balance for heating of spherical targets                                                                                                     | 178 |
| <b>9 Scattering of the laser radiation in the vicinity of the critical density surface</b>                                                                             | 189 |
| 9.1 Mechanisms of second harmonic generation in a laser-produced plasma                                                                                                | 189 |
| 9.2 The angular distribution and polarisation of the second harmonic                                                                                                   | 194 |
| 9.3 The spectral distribution of the second harmonic emission                                                                                                          | 197 |
| 9.4 Intensity of the second harmonic emission                                                                                                                          | 206 |
| 9.5 Diagnostic methods for the critical density region for inhomogeneous plasmas created on shell targets using second harmonic emission                               | 210 |
| <b>10 Scattering of laser radiation in the vicinity of the <math>n_c/4</math> density</b>                                                                              | 220 |
| 10.1 Parametric turbulence in the $n_c/4$ region, the generation of multiple sub-harmonics                                                                             | 220 |
| 10.2 Polarisation and the angular distribution of the $3\omega_0/2$ harmonic                                                                                           | 226 |
| 10.3 Spectral distribution of the $3\omega_0/2$ harmonic emission                                                                                                      | 231 |
| 10.4 Evolution of the spectrum and intensity of the $3\omega_0/2$ harmonic during the laser pulse                                                                      | 242 |

|                                                                                                                        |     |
|------------------------------------------------------------------------------------------------------------------------|-----|
| 10.5 The intensity of the $3\omega_0/2$ emission                                                                       | 246 |
| 10.6 Experimental studies of other half-integer harmonics of the laser frequency                                       | 252 |
| 10.7 The generation of fast electrons by the two-plasmon decay instability                                             | 256 |
| <b>11 Investigation of parametric turbulence using Raman scattering of a probing beam</b>                              | 260 |
| 11.1 Raman scattering as a diagnostic method of an inhomogeneous plasma (the general picture)                          | 260 |
| 11.2 Observation of the two-plasmon instability by optical probing of the plasma                                       | 264 |
| 11.3 Measurement of the spectrum of parametric turbulence in the $n_c/4$ region                                        | 267 |
| 11.4 Scattering of probing radiation in the critical region                                                            | 275 |
| <b>12 The formation and dynamics of the plasma corona using spherical targets</b>                                      | 279 |
| 12.1 The hydrodynamics of the corona of a laser-produced plasma: an analytical description                             | 280 |
| 12.2 Experimental determination of the spatial distribution of the hydrodynamic parameters in the plasma corona        | 290 |
| 12.3 Non-linear processes arising in the vicinity of the critical density and their effect on the plasma hydrodynamics | 302 |
| 12.4 Experimental studies of perturbations in the density profile in the plasma corona                                 | 309 |
| <b>13 Investigation of hydrodynamic acceleration of targets</b>                                                        | 319 |
| 13.1 Measurement of the hydrodynamic efficiency in foil experiments                                                    | 320 |
| 13.2 Experimental investigations of the ablation rate                                                                  | 327 |
| 13.3 Discussion of the results                                                                                         | 333 |
| <b>14 Investigation of the energy spectrum of superthermal particles emitted from a plasma</b>                         | 339 |
| 14.1 The mechanism of acceleration of ions                                                                             | 339 |
| 14.2 Experimental investigation of fast particles in laser-produced plasmas                                            | 345 |
| <b>15 Studies of the compression dynamics of shell targets</b>                                                         | 357 |
| 15.1 Time-integrated measurements of the implosion velocity for microspheres                                           | 358 |
| 15.2 Optical recording of the motion of the critical region                                                            | 361 |
| 15.3 Evolution of the shape of the second harmonic spectrum and the velocity of the collapsing shell                   | 364 |
| 15.4 Observation of a perturbation wave on the density profile of the corona of shell targets                          | 368 |
| 15.5 Application of X-ray streak cameras to the diagnosis of compression                                               | 370 |
| 15.6 Probing the plasma using X-ray radiation generated from an external source                                        | 375 |
| <b>16 Investigation of the state of the compressed core</b>                                                            | 385 |
| 16.1 The effect of different perturbations on the stability of the compression in the different regimes                | 386 |
