

CONTENTS

PREFACE.	vii
CHAPTER I BASIC MATHEMATICAL CONCEPTS OF WAVES AND RAYS IN PLASMAS.	1
1. The Wave Equation.	1
2. Homogeneous Isotropic Media.	3
Dispersive Media	4
3. Non-Homogeneous Isotropic Media; The Geometrical Optics Approximation and the Eikonal Equations.	7
Rays	9
Nature of the Approximation.	9
Amplitude Variations and the Fluid Analogue.	13
4. The Fourier Transform and Wave Packets in Homogeneous Media.	14
Plane Monochromatic Waves.	14
Wave Trains.	15
Wave Packets	15
Locally Plane Waves.	16
Propagation.	18
The Principle of Stationary Phase.	19
Bandwidth and Uncertainty Relations.	20
5. Wave Packets in Non-Homogeneous Media.	25
Absorbing Media.	25
6. Fermat's Principle and Its Extension	29
Generalization Postulates.	30
7. The Poynting Vector and Energy Flow.	33
CHAPTER II THE HOMOGENEOUS ELECTRON PLASMA IN A UNIFORM MAGNETIC FIELD.	39
8. The Lorentz Theory	39
9. Propagation in an Isotropic Conducting Medium.	40
Refraction and Extinction Indices.	44
Cases for Limiting Frequencies	45
Relations Between the Electric and Magnetic Field Vectors	46
10. Propagation in a Homogeneous Anisotropic Medium.	47
Anisotropy	47
Dispersion Equation.	49
Conductivity Tensor.	50
Propagation in an Ionized Medium	51
Mechanism of Propagation of the Electromagnetic Waves.	51
The Plasma—Crystal Optics Analogy	52

CONTENTS

11. The Plasma in an Applied Magnetic Field	52
Gyrotensor Ω	53
Effective Displacement.	54
Dispersion Equation	56
12. The Electromagnetic Fields in the Non-Conducting Crystal.	58
13. Electromagnetic Fields in the Birefringent Plasma	61
Canonical Transformation to a Mathematical System	62
Principal Dielectric Constants of the Plasma.	64
Dispersion Equation for the Plasma.	66
The Electromagnetic Field in the Plasma	67
14. The Appleton-Hartree Formula.	67
Ordinary and Extraordinary Modes of Propagation	71
15. Polarization of Light in the Plasma	72
The Polarization Ellipse.	74
Representation and Interpretation of Transformed Fields.	76
16. Plasma Oscillations	78
Zeeman Effect	81
17. A Generalized Dispersion Equation for Propagation of Waves in an Electron Plasma.	82
18. Faraday Rotation.	84
Circular Polarization	85
Longitudinal Propagation.	86
Collision Effects	89
Magnetic Effects.	90
Power Transmission.	92
Special Cases	93
Transverse Propagation.	97
19. Faraday Rotation: General Case	98
CHAPTER III A RÉSUMÉ OF THE HYDRODYNAMICAL EQUATIONS AND SHOCK CONDITIONS FOR GASES	105
20. Basic Considerations and Nomenclature. Viscous and Compressible Fluids	105
21. Basic Dynamical Assumptions	107
22. Variable Boundaries and Differentiation of Integrals.	109
23. The Equation of Continuity.	109
24. The Stress Vector and Stress Tensor	111
25. The Distortion Tensor	112
26. Pressure and Viscosity Tensor	113
27. The Relation Between the Distortion and Viscosity Tensors	114
28. Homogeneous and Isotropic Fluids.	114
29. The Navier-Stokes Equations	115
30. Perfect or Ideal Gases—The Equation of Energy.	117
31. The Thermal Conductivity.	118
32. Entropy Considerations.	120
33. The Equations for Ideal Gases	122
34. Bernoulli's Equation.	123

CHAPTER III

CONTENTS

35. Shock Waves in an Ideal Gas—The Concept of Singular Surfaces	123
36. The First Shock Condition.	125
37. The Rankine-Hugoniot Relation	129
38. The Combined Shock Conditions	131
39. The Density and Entropy Changes in Passage Through a Shock Wave	132
CHAPTER IV THE HOMOGENEOUS IONIC PLASMA IN A MAGNETIC FIELD	135
40. The Basic Equations	139
Oscillations of an Electron Plasma in a Uniform Magnetic Field	146
Longitudinal Magnetic Field, $\omega_T = 0$	147
Conditions for Propagation	148
Pure Transverse Magnetic Field, $\omega_L = 0$	150
41. Electromagnetic Waves in the Plasma	155
Longitudinal Propagation	161
Transverse Propagation	162
42. Magnetohydrodynamic Waves—Low Frequency Phenomena	164
General Low-Frequency Solutions	167
43. Fields and Currents in Weakly Ionized Media	172
Dispersion Relation	173
Current and Force Densities	175
Longitudinal Component, J_L	176
Transverse Component	177
Longitudinal Component	181
Transverse Component, F_T	182
44. Approximations—(High Collision Frequencies)	185
Low Collision Frequencies	186
45. Related Investigations	187
Velocity Modes	192
Pressure Modes	192
Ideal Compressible Fluid Zero Viscosity, No Expansive Friction, Zero Heat Conductivity	194
Normal Modes	194
Ideal Elastic Solids	195
Shear Modes	197
Shear Compression Modes	198
Torsional Magneto-Hydrodynamic Waves	199
Cylindrical Velocity Modes	199
46. The Reflection and Refraction of Magneto- Hydrodynamic Waves	201
CHAPTER V ENERGY CONSIDERATIONS AND ELECTRODYNAMICS	211
47. Electromagnetic Force—Poynting's Theorem	212
48. Complex Poynting Theorem	215
Moving Bodies—Relativistic Considerations	217
49. Forces and the Electromagnetic Stress-Tensor	223
50. Conducting Fluids	231
51. Energy and Work Relations	233

52.	The Thermodynamics of a Conducting Fluid	237
53.	An Alternative Formulation of the Energy Relation	240
54.	The Energy Equation for an Ionized Gas in the Presence of a Magnetic Field	241
55.	Some Comments on Irreversible Thermodynamics	247
56.	The Energy Equation for Magnetohydrodynamics	248
57.	Fully Ionized Gas in a Strong Magnetic Field	250
58.	Circuit Considerations for a Plasma	252
	Thermal Energy Equation	252
	Momentum Equation	253
	Generalization of Ohm's Law	253
	Lumped Parameters	256
59.	Circuit Dynamics	259
60.	Magnetohydrodynamic Shocks	262
61.	The Conservation Laws	265
62.	The Entropy Change Across a Shock Front	267
63.	Dimensional Considerations—Scaling in Magnetohydrodynamics	269
64.	Remarks on the Electrodynamics of Moving Matter	269
	In Vacuum	269
	In Isotropic Matter	270
	In Anisotropic Matter	270
	Field Quantities	270
	The Constitutive Equations in Non- Conducting Isotropic Material	274
	Wave Propagation in Moving Non-Conducting Isotropic Matter	276
	Electromagnetic Energy Transport	276
CHAPTER VI	THE STRUCTURE OF WAVES IN NON-HOMOGENEOUS MEDIA	281
65.	Propagation in Non-Homogeneous Media	281
	Rays in Isotropic Media	282
	Energy Attenuation	286
	The Path of a Light Ray in an Inhomogeneous Absorbing Medium	287
	Application of the Extended Fermat Principle to a Stratified Medium	291
66.	Propagation of Electromagnetic Waves in Unbounded Non- Homogeneous, Anisotropic Media. Derivation of the Basic Equations	292
	Special Case of a Homogeneous, Anisotropic Plasma	295
	Isotropic, Inhomogeneous Plasma	297
67.	Properties of the Waves when Inhomogeneities Are Present	298
	Longitudinal Propagation	298
	Transverse Propagation	299
	Transverse Variations (Longitudinal Propagation)	300
	Ordinary and Extraordinary Waves (Transverse Propagation)	300
68.	Refractive Index Considerations	303
	Dielectric Tensor Varying in the Direction of Propagation	304
	Ordinary and Extraordinary Waves in the Case of the Dielectric Tensor Varying in the Direction of Propagation	305

69.	Reflection Coefficients	305
	Stratified Media	308
70.	Cylindrical Waves	311
	Homogeneous Anisotropic Case	313
	Reflection from a Homogeneous Cylindrical Plasma	314
	Cylindrically Stratified Media	317
71.	Continuous Stratified Media	322
	Reflection and Transmission Operators	323
	The Structure of the Operators L and K	324
	The Integral Equation	328
	Properties of the Matrices A_r and A_t	332
72.	Functional Analysis and Variational Formulae	335
CHAPTER VII	THE THEORY OF PROPAGATION OF RAYS IN AN INHOMOGENEOUS, ANISOTROPIC, DISPERSIVE AND ABSORBING MEDIUM	345
73.	The Variational Principle	345
	Geometrical Representation	354
	Reciprocal Surfaces	356
74.	Derivation of the Ray Path Equations	363
75.	An Equivalent Formulation	368
76.	Ray Propagation	372
77.	The Characteristic Surfaces	374
78.	The Group Property of the Construction	375
79.	Reflection and Refraction	378
80.	Snell's Law for an Anisotropic Medium	382
81.	Curvature of the Rays	384
82.	Group Velocity from Ray Theory—An Imbedding Process	387
83.	The Equivalent Path and Absorption	393
84.	Absorption Considerations	395
85.	The Connection Between Hamilton's Equations, Pulses and a General Variational Principle	399
86.	An Alternative Description of the Ray Direction	402
87.	The Ray-Wave Connection in a General Refracting Anisotropic Medium	405
88.	The Ray Path Equations in a General Coordinate System	410
89.	The Ray Path Equations in Terms of the Physical Components	419
90.	The Ray Path Equations in Terms of the Physical Components for an Orthogonal Curvilinear System	421
91.	The Spread or Dispersion of the Rays Based on the Concept of Geodesic Deviation	423
92.	The Approach to Ray Propagation in Anisotropic Media via Maxwell's Equations	427
93.	Non-Homogeneous Media	429
94.	Amplitude Variations—Field and Amplitude	434
CHAPTER VIII	PROPAGATION PHENOMENA BASED ON THE BOLTZMANN EQUATION—MICROSCOPIC CONSIDERATIONS	441
	Introductory Remarks	441

CONTENTS

95.	Preliminary Concepts	446
	Shielding.	447
	Equilibrium Considerations	450
	Non-Equilibrium Considerations	451
96.	Phase Space; The Liouville and Boltzmann Equations	453
97.	Deductions from the Boltzmann Equation	459
	Self Consistent Formulation.	463
	Moments of the Boltzmann Equation.	464
	Equations of Stress and Heat Flux.	467
	Stress Equation.	472
	Heat Flux Equations.	473
	The Distribution Function.	474
	Alternative Representations of the Conservation Laws.	478
	Plasma Diamagnetism.	480
	A Virial Theorem	482
	Self Confinement of a Plasma	484
98.	The Collision Term	484
	Plasma Oscillations and Collective Coordinates	486
	The Close Collision Term	491
	The Fokker-Planck Term	493
	The Spherical Polar Representation of Boltzmann's Equation	495
	The Fokker-Planck Term in Spherical Polars	500
99.	Solutions of Boltzmann's Equation.	505
	Thermodynamic Considerations	507
100.	Propagation Considerations	513
	Polarization	518
	Computational Considerations	518
	Statistical Meaning of the Dielectric Coefficients	520
	Microscopic Versus Macroscopic Theory.	522
	Collision Effects at Low Frequency	523
	The Magneto-Hydrodynamic Approximation, Low Collision Frequency.	525
<i>CHAPTER IX</i>	<i>RADIATION IN A PLASMA.</i>	<i>537</i>
	Introductory Remarks	537
101.	Radiative Processes in an Ionized Gas.	539
	Cross-Section for Absorption by a Free Electron— The Absorption Coefficient	541
102.	Radiation in Anisotropic Media	545
103.	The Tensor (or Dyadic) Green's Functions	549
104.	General Case	552
	Power Dissipation and Quadratic Forms.	555
105.	Wave Excitation.	561
106.	Radiated Power	566
107.	Electromagnetic Scattering and Reflection.	574
108.	Radiation from a Slot.	576
109.	Radiation from an Elementary Current—Sheet Dipole	580
	Problems on Chapters	589
	Indexes—Author, Subject	681
