

CONTENTS

List of Contributors	v
Preface	vii

I. Introduction to the Molecular-Transport Equations of Dilute Gases

I. OPPENHEIM

I. Introduction to Statistical Mechanics	1
II. Relaxation-Time Spectrum	6
III. Introduction to Transport Equations	9
IV. Equations of Motion and Kinetic Equations	12
V. Stochastic Equations and Kinetic Equations	20
References	22

II. Derivation of Hydrodynamic Equations from the Boltzmann Equation

HANS C. ANDERSEN

I. Introduction	26
II. Physical Basis for Hydrodynamic Equations	26
III. The Boltzmann Equation and the Equations of Change	28
IV. Chapman-Enskog Expansion Method	33
V. Hydrodynamic Equations for "Almost-Frozen" Flow	35
VI. Hydrodynamic Equations for Local Chemical Equilibrium	43
VII. Hydrodynamic Equations for a System in Which the Vibrational Temperature Is Not Equal to the Translational Temperature	47
VIII. Conclusion	53
References	54

III. Transport in Neutral Gases

E. A. MASON

I. Introduction	57
II. General Theory	59
III. Viscosity	64
IV. Thermal Conductivity	70
V. Diffusion	81
VI. Pressure Diffusion and Thermal Diffusion	84
VII. Summary of Calculation Recipes	89
VIII. Determination of Intermolecular Forces	91
IX. Available Tabulations	94
References	97

IV. Kinetic Equations for Fully Ionized Plasmas

C. M. TCHEN

I. Introduction	101
II. Liouville Equation and BBGKY Hierarchy	102
III. Vlasov Equation	104
IV. Generalized Fokker-Planck Equation for Slowly and Rapidly Varying Processes	104
V. Lenard-Balescu Equation	107
VI. Fokker-Planck Equation with Memory	108
VII. Silin Kinetic Equation for Rapidly Varying Processes	109
VIII. Linearization	110
Appendix. Derivation of the Shielding Function	110
References	114

V. The Boltzmann and Fokker-Planck Equations

M. B. LEWIS

I. Introduction	115
II. Derivation of the Fokker-Planck Equation from the Boltzmann Equation	116
III. Derivation of the Fokker-Planck Equation from a Markov Process	124
IV. Derivation of the Boltzmann and Fokker-Planck Equations from the Liouville Equation	132
References	139

VI. Calculations of Transport Coefficients in Ionized Gases

A. R. HOCHSTIM and G. A. MASSEL

Introduction	142
I. Macroscopic Rates and Transport Coefficients for Plasma	148
II. Continuity Equation and Current Transport Coefficients	149

III. Ambipolar Electron Diffusion	151
IV. AC Electric Conductivity and Dielectric Constant	154
V. Energy Equation and Energy Transport Coefficients	157
VI. Thermoelectric Effect and Effective Coefficient of Thermal Conductivity	160
VII. Einstein and Onsager Relations between Current and Energy Transport Coefficients	161
VIII. Generalized Wiedmann-Franz Law	163
IX. Discussion of the Kinetic Description of Ionized Gases	164
X. General Form of the Collision Integral	166
XI. Spherical Harmonics Expansion and Logarithmic Cutoffs	167
XII. Transport Properties in Slightly Ionized Gases	173
XIII. Transport Properties Including Electron-Electron Collisions	188
XIV. General Ohm's Law and Hall Conductivities	189
XV. Ion Contributions to the Transport Properties in Plasmas	192
XVI. Convergence of the Laguerre Expansion for Electron Transport Coefficients	216
XVII. Summary of Notations, Examples, and Numerical Results for Electron Transport Coefficients	221
Appendix A. Laguerre Polynomials and Products	239
Appendix B. Elements of 20×20 Matrix	243
References	251

VII. Chemical Reactions in High-Temperature Gases as Collision Processes

FELIX T. SMITH

I. Introduction	257
II. The Place of Chemical Kinetics in the Domain of Collision Processes	260
III. Gaseous Statistics and the Boltzmann Equation for Chemical Reactions	264
IV. Collisions	268
V. Reaction Cross Sections and Reaction Rates	278
References	280

VIII. Rate Coefficients, Reaction Cross Sections, and Microscopic Reversibility

JOHN ROSS, JOHN C. LIGHT, and KURT E. SCHULER

I. Introduction	281
II. Reaction Cross Sections and Rate Coefficients	285
III. Examples of Relation between σ_k and k_σ	295
IV. Microscopic Reversibility and Detailed Balance	307
References	320

IX. Triple Collisions and Termolecular Reaction Rates

FELIX T. SMITH

Introduction	321
I. The Standard Gas-Kinetic Triple Cross Section	324
II. Bodenstein's Theory and the "Collision Time"	326
III. Repulsive Collisions	328
IV. Attractive Collisions: The Collision Lifetime	329
V. Lifetime and Binary Cross Sections	332
VI. Quantum Effects in the 2-Body Lifetime	334
VII. Electronic States and Curve Crossings	346
VIII. Modes of 3-Body Collision: Entry	351
IX. Modes of 3-Body Collision: Exit	359
X. Gradual Stabilization and Successive Collisions	372
XI. Many-Body Interactions	375
XII. Experiment and Theory	377
References	380

X. Methods for Calculating Inelastic Collision Cross Sections in Low-Energy Collisions

ERNEST BAUER

I. Introduction	382
II. Inelastic Collisions of Electrons with Atoms and Molecules	386
III. Slow Inelastic Collisions of Heavy Particles	400
IV. The Interaction Potentials	413
Appendix A. Coupling of Electronic and Nuclear Motions: The Born-Oppenheimer Terms	421
Appendix B. Close Coupling Calculations (by R. Marriott)	422
References	424
