

CONTENTS

1	Historical Introduction	1
1.1	Carnot's Principle	1
1.2	Thomson and the caloric theory	3
1.3	The laws of thermodynamics	6
1.4	Clausius' entropy function	9
1.5	The Maxwell-Gibbs inequalities	12
1.6	Boltzmann's inequality	14
1.7	Statistical thermodynamics	17
1.8	Shannon's entropy	19
1.9	The second law in continuum mechanics	21
1.10	Concluding remarks	24
2	Equations of equilibrium thermodynamics	26
2.1	Simple, closed systems	26
2.2	Open systems	30
2.3	Mixtures of perfect gases	32
2.4	Maxwell's equilibrium distribution function	35
2.5	Generalized Gibbs relation	37
2.6	The Gibbs relation for a system of perfect gases	39
2.7	Intrinsic entropy	41
2.8	Stability, equilibrium, and natural processes	43
3	Principles of irreversible thermodynamics	46
3.1	Irreversible processes	46
3.2	Motion reversed parities	49
3.3	Basis for the reciprocal relations	52
3.4	The reciprocal relations	54
3.5	Discussion of the reciprocal relations	57
3.6	Internal structure and its entropy production	60
4	Continuum thermodynamics	64
4.1	Local thermodynamic equilibrium	64
4.2	Simple fluids	69
4.3	Motion of a fluid element	71
4.4	Entropy production rate	74
4.5	Knudsen number expansions	77
4.6	Conservation laws for fluid mixtures	79
4.7	Dissipation in fluid mixtures	83

4.8	Minimum entropy production	87
5	Constitutive Equations	92
5.1	Frame indifference	92
5.2	Material invariance	95
5.3	A single-component fluid	99
5.4	Transverse isotropy	101
5.5	Mixtures	107
5.6	Bulk viscosity	111
6	Higher-order transport	115
6.1	Second-order entropy	115
6.2	Second-order heat flux	119
6.3	Second-order viscous stress tensor	123
6.4	Generalized heat flux law	127
6.5	Thermal waves	128
6.6	Entropy production rate	131
6.7	Extended irreversible thermodynamics	135
6.8	Rational thermodynamics	139
7	Transport in magnetoplasmas	148
7.1	First-order heat flux	148
7.2	First-order viscous stress tensor	153
7.3	Second-order transport	155
7.4	Entropy production rate	158
7.5	A cylindrical magnetoplasma	160
7.6	Unstable current distributions	163
7.7	Plasma flow across strong magnetic fields	168
7.8	Rate of dissipation of magnetic field	171
8	Kinetic processes	178
8.1	Kinetic equations	178
8.2	The peculiar velocity	182
8.3	Kinetic equation in the convected frame	185
8.4	Constraints on the collision operator	187
8.5	Collision operator for intermediate kinetic theory	189
8.6	First-order constitutive equations	195
8.7	Higher-order constitutive equations	197
8.8	Boltzmann's equation	201
8.9	The equilibrium distribution function	206
8.10	Entropy production rate	210
9	Laboratory Applications	216
9.1	Ultrasonic wave propagation	217
9.2	Strong shock waves	221

9.3	Energy transport from tokamaks	225
9.4	Stability of tokamaks	236
10	Astrophysical Applications	243
10.1	Instability in the solar magnetic field	244
10.2	Time-scale for the evolution of a pore	247
10.3	Comparison of theory and observation	253
10.4	Plasma loops in the solar corona	255
10.5	The decay of loops	261
10.6	Solar flares	267
	Index	271
