Introduction		xiii
1	**Foundation of radiation theory**	**1**
1.1	Maxwell's equations	2
1.2	Conservation of energy and the Poynting vector	4
1.3	Wave propagation	5
1.4	Polarization	11
1.5	Boundary conditions	12
1.6	Reflection, refraction, and the Fresnel equations	14
1.7	The Planck function	18
1.8	The Poynting vector, specific intensity, and net flux	21
2	**Radiative transfer**	**24**
2.1	The equation of transfer	25
	a. Definitions and geometry	25
	b. Microscopic processes	26
	c. The total field	33
	d. The diffuse field	35
2.2	Formal solutions	37
2.3	Invariance principles	39
	a. Definitions	39
	b. The stacking of layers	40
	c. Composite scattering and transmission functions	41
	d. Starting solutions	43
2.4	Special cases	45
	a. Nonscattering atmospheres	45
	b. Optically thin atmospheres	46
2.5	Scattering atmospheres; the two-stream approximation	46

a. Single scattering phase function 46
b. Separation of variables 47
c. Discrete streams 48
d. Homogeneous solution 49
e. Outside point source 50

3 Interaction of radiation with matter 52
3.1 Absorption and emission in gases 53
a. The old quantum theory 53
b. The Schrödinger equation 54
c. Energy levels and radiative transitions 56
3.2 Vibration and rotation of molecules 58
3.3 Diatomic molecules 60
a. Vibration 60
b. Rotation 65
c. Vibration–rotation interaction 68
d. Collision induced transitions 70
3.4 Polyatomic molecules 72
a. Vibration 73
b. Rotation 78
c. Vibration–rotation transitions 81
3.5 Line strength 86
3.6 Line shape 90
3.7 Solid and liquid surfaces 94
a. Solid and liquid phases 94
b. Complex refractive indices 96
3.8 Cloud and aerosol particles 101
a. Asymptotic scattering functions 101
b. Rigorous scattering theory; general solution 102
c. Particular solutions and boundary conditions 106
d. The far field; phase function and efficiency factors 110

4 The emerging radiation field 117
4.1 Models with one isothermal layer 117
a. Without scattering 117
b. With scattering 119
4.2 Models with a vertical temperature structure 128
a. Single lapse rate 128
b. Multiple lapse rates 131
4.3 Model with realistic molecular parameters 135

5 Instruments to measure the radiation field 139
5.1 Introduction to infrared radiometry 141
5.2 Optical elements 142

5.3 Diffraction limit 152
5.4 Chopping, scanning, and image motion compensation 156
a. D.C. radiometers 156
b. Chopped or a.c. radiometers 162
c. Image motion compensation 170
5.5 Intrinsic material properties 174
a. Absorbing and reflecting filters 174
b. Prism spectrometers 176
c. Gas filter, selective chopper, and the pressure modulated radiometer 178
5.6 Interference phenomena in thin films 179
a. Outline of thin film theory 180
b. Antireflection coatings 182
c. Beam dividers 185
d. Interference filters and Fabry–Perot interferometers 187
5.7 Grating spectrometers 193
5.8 Fourier transform spectrometers 201
a. Michelson interferometer 201
b. Post-dispersion 216
c. Martin–Puplett interferometer 221
d. Lamellar grating interferometer 224
5.9 Heterodyne detection 226
5.10 Infrared detectors in general 231
5.11 Thermal detectors 233
a. Temperature change 233
b. Noise in thermal detectors 237
c. Temperature to voltage conversion 241
5.12 Photon detectors 248
a. Intrinsic and extrinsic semiconductors 249
b. Photoconductors and photodiodes 250
c. Responsivities 251
d. Noise in photon detectors 253
e. Circuits for photon detectors 254
f. Detector arrays 256
5.13 Calibration 256
a. Concepts 256
b. Middle and far infrared calibration 259
c. Near infrared calibration 265
d. Wavenumber calibration 267
5.14 Choices of measurement techniques 269
a. Scientific objectives 269
b. Instrument parameters 270

6 The measured radiation field **275**
6.1 Instrument effects 275
6.2 The terrestrial planets 279
6.3 The giant planets 290
6.4 Titan 294
6.5 Objects without substantial atmospheres 299
a. Tenuous atmospheres 299
b. Surfaces 300

7 Retrieval of physical parameters from measurements **307**
7.1 Retrieval of atmospheric parameters 307
7.2 Temperature profile retrieval 310
a. General consideration 310
b. Constrained linear inversion 315
c. Relaxation algorithms 318
d. Backus–Gilbert formulation 319
e. Statistical estimation 322
f. Limb-tangent geometry 323
7.3 Atmospheric composition 325
a. Principles 325
b. Feature identification 326
c. Correlation analysis 326
d. Abundance determination 331
e. Profile retrieval 332
f. Simultaneous retrieval of temperature and gas abundance 335
g. Limb-tangent observations 336
7.4 Clouds and aerosols 339
a. Small absorbing particles 339
b. Titan's stratospheric aerosol 340
7.5 Solid surface parameters 343
a. Surface temperature 343
b. Thermal inertia 346
c. Refractive index and texture 349
7.6 Photometric investigations 352
a. Introduction 352
b. The bond albedo 353
c. Thermal emission 359

8 Interpretation of results **362**
8.1 Radiative equilibrium 362
a. Governing principles 363
b. The solar radiation field 364

c. Thermal radiation and the temperature profile 366
d. General atmospheric properties 369
8.2 Atmospheric motion 375
a. Governing equations 375
b. Mars 383
c. The outer planets 389
d. Venus 394
8.3 Evolution and composition of the Solar System 397
a. Formation of the Solar System 398
b. Evolution of the terrestrial planets 402
c. Evolution of the giant planets 405
8.4 Energy balance 410
a. The terrestrial planets 411
b. The giant planets 411

Closing remarks 416

Appendices 418
1 Mathematical formulas 418
2 Physical constants 421
3 Planetary and satellite parameters 422
