PREFACE TO THE ENGLISH EDITION	xiii
INTRODUCTION	
General discussion of the role of plasma processes under cosmic conditions	1
In how far is plasma astrophysics different from laboratory plasma physics?	3
Plasma turbulence astrophysics	4
Statement of the problems in plasma astrophysics and contents of the present book	7
CHAPTER 1. The Physics of Plasma Turbulence	
§ 1. The frequencies and waves of plasma turbulence	11
Characteristic frequencies of plasma processes	11
Types (modes) of collective waves in a plasma	15
§ 2. Emission and absorption mechanisms for waves in a plasma	25
Energy spectral density and number of waves in plasma turbulence	26
Spontaneous emission mechanisms for waves in a plasma	28
Stimulated emission and absorption of waves in a plasma	33
§ 3. Non-linear wave interactions in a plasma	37
Non-linear scattering of waves by thermal ions and electrons in a plasma	38
Decay and fusion of waves in a plasma	46
§ 4. Nature, spectrum, and excitation of plasma turbulence	51
Langmuir wave (longitudinal plasmon) turbulence	55
Ion-sound turbulence and anomalous plasma resistivity	64
Magnetohydrodynamic plasma turbulence	68
Excitation of plasma turbulence and plasma instabilities	69
§ 5. Diffusion of charged particles and of electromagnetic radiation in the field of plasma turbulence	73
Fast particle acceleration in a plasma	74
Scattering of electromagnetic waves in a turbulent plasma	81
Amplification of high-frequency electromagnetic radiation during its propagation through a turbulent plasma	85
Some non-linear transfer equations for electromagnetic radiation	86
§ 6. Laboratory studies of plasma turbulence and possible laboratory models for cosmic plasma phenomena	88
Some experimental data on particle acceleration in a turbulent plasma	89
Anomalous plasma resistivity	92
Plasma turbulence emission	97
Laboratory models for cosmic plasma phenomena	98
CHAPTER 2. Sporadic Radio-emission of the Sun (Turbulent Processes in a Non-Relativistic Plasma)	
§ 7. Observational data on the sporadic solar radio-emission	101
Electron density and temperature distribution in the outer solar atmosphere	102

Contents

Chromospheric flares	103
Fast-drifting radio-bursts (type III, V and U bursts)	104
Slowly drifting or stationary radio-bursts (type II, IV and I bursts, noise storms)	109
Radar observations of the Sun	114
§ 8. Excitation of longitudinal and transverse plasmon turbulence by a beam instability	115
Quasi-linear beam relaxation	116
Non-linear beam stabilization	118
Longitudinal and transverse plasmon turbulence	124
Escape of the radio-emission from turbulence regions	128
Influence of a magnetic field on the longitudinal and transverse plasmon turbulence	130
§ 9. Electromagnetic radiation from ion-sound turbulence	133
Fast electrons in shock waves	133
Emission at plasma frequencies from regions of magnetic field gradients (shock waves)	136
Accumulation of particles in magnetic traps by ion-sound turbulence	138
§ 10. Discussion of the theory of solar radio-bursts	140
Type III, V, and U radio-bursts	140
Type II radio-bursts	145
The interpretation of “long-lived” stationary bursts	147
The interpretation of radar observations	148
Particle acceleration in chromospheric flares	149
CHAPTER 3. Galactic Nuclei, Radio-galaxies, Quasars (Turbulent Processes in a Plasma with an Admixture of Ultra-relativistic Electrons)	
§ 11. Brief summary of observational data on galactic nuclei, radio-galaxies, and quasars	151
Characteristic properties of galactic nuclei	151
Activity of galactic nuclei, quasars	153
Radio-galaxies, outbursts and their radio-spectra	156
§ 12. Emission by ultra-relativistic particles in a plasma	158
The distribution function of the relativistic particles	158
Spontaneous synchrotron emission of electromagnetic and Langmuir waves	161
Cherenkov emission of Langmuir and Alfvén waves by relativistic particles	165
Stimulated emission and reabsorption of relativistic electrons	168
Anisotropic distributions and excitation of plasma waves by relativistic particles	174
Stabilization of relativistic particle instabilities	176
§ 13. Plasma and Compton emission mechanisms of ultra-relativistic particles	179
Analysis of the conservation laws for scattering	180
Non-linear scattering of electromagnetic and Langmuir waves by relativistic ions	182
Compton scattering of electromagnetic and Langmuir waves by relativistic electrons	184
Amplification and stabilization of the electromagnetic radiation generated in Compton scattering of Langmuir and electromagnetic waves	189
Polarization of the electromagnetic emission from a turbulent plasma	194
Bremsstrahlung mechanisms for relativistic electrons and ions in a turbulent plasma	198
§ 14. Plasma turbulent reactors for relativistic electrons	199
Electromagnetic radiation spectrum in a turbulent reactor	200
Acceleration of electrons through absorption of electromagnetic radiation	203
Formation of a power-law energy distribution function in a plasma reactor	205
§ 15. The interpretation of the electromagnetic radiation of galactic nuclei, radio-galaxies, and quasars	210
Synchrotron interpretation of the radio-emission of cosmic sources	210
Plasma interpretation of the emission from powerful radio-sources	213
Infra-red emission sources in galactic centres and the possibility of a direct emission from a plasma turbulence reactor	215
Relativistic electron beams in the intergalactic and the galactic space and the interpretation of outburst emission	216

CHAPTER 4. Pulsar Emission (Turbulent Processes of a Relativistic Plasma in a Strong Magnetic Field)	
§ 16. Observational data about pulsars	219
Radio-emission of the pulsars	220
The Crab pulsar	223
§ 17. A relativistic plasma in a strong magnetic field	226
Dispersion relations for an ultra-relativistic plasma without a magnetic field	226
Non-linear interactions in an ultra-relativistic plasma without a magnetic field	229
Dispersion relations for an ultra-relativistic plasma in a very strong magnetic field	230
Instability of Alfvén waves in an ultra-relativistic plasma in a strong magnetic field	236
Non-linear wave interactions in an ultra-relativistic plasma in a strong magnetic field	239
§ 18. Emission by an ultra-relativistic plasma in a strong magnetic field	240
Emission mechanisms in a very strong magnetic field	241
Spectral emission coefficients	245
Reabsorption coefficients	246
Radiative compression of the particle motion towards the magnetic field lines	248
§ 19. Turbulent reactors in a relativistic plasma	249
Turbulent reactors in a relativistic plasma in a weak magnetic field	250
Spectral radiation intensity in an optically dense relativistic plasma in a strong magnetic field	251
Particle acceleration through absorption of electromagnetic radiation	252
Turbulent reactor in a relativistic plasma in a strong magnetic field	254
§ 20. The interpretation of pulsar emission	257
Transfer of rotational energy to the close circumpulsar space and its properties	258
Synchrotron hypothesis of pulsar emission	263
Compton mechanism hypothesis for the emission in a weak magnetic field	264
The hypothesis of cyclotron and magneto-brems emission of a plasma in a strong magnetic field	266
Pulsars and the activity of supernova shells	269
CONCLUSION. Problems for the Further Development of Plasma Astrophysics	
Unsolved problems in plasma astrophysics	271
The problem of the cosmic-ray spectra	272
APPENDIX. Tables of Averaged Probabilities for Plasma Processes	275
REFERENCES	289
INDEX	297
