

INDICE

R. GIACCONI and R. RUFFINI – Introduction.. . . . pag. xxi

Gruppo fotografico del partecipanti al Corso fuori testo

S. CHANDRASEKHAR – Why are the stars as they are?

1. Eddington's parable	pag. 1
2. The $(1-\beta_*)$ -theorem and the combination $(hc/G)^{\frac{1}{2}}H^{-2}$. . . »	2
3. « Have the stars enough energy to cool? »: Eddington's paradox and Fowler's resolution »	5
4. The theory of degenerate configurations; the limiting mass »	7
5. A criterion when stars can develop degenerate cores . . »	10
6. The minimum mass for gravitational collapse to be possible »	13

EXPERIMENTAL PAPERS

R. GIACCONI – Review of observations of compact sources.

1. Introduction	» 17
2. Her X-1	» 19
3. Cen X-3	» 30
4. Cyg X-1	» 37

Y. AVNI – Mass estimates from optical-light curves for binary X-ray sources.

1. Introduction	» 43
2. The standard picture	» 44
2'1. The potential.	» 44
2'2. Von Zeipel's theorem	» 45

2'3.	The emitted flux	pag.	46
2'4.	Geometry of the surface.	»	46
2'5.	Calculational procedures and approximations	»	48
2'6.	Qualitative features of light curves	»	50
2'7.	Local effects of X-ray heating	»	50
3.	Discussion of the standard picture	»	50
3'1.	Model-dependent analyses	»	50
3'2.	Observational aspects	»	51
3'3.	Theoretical aspects	»	51
3'4.	Usefulness	»	51
4.	Applications.	»	52
4'1.	HED 226868 - Cyg X-1	»	52
4'2.	Krzeminski's star-Cen X-3	»	53
4'3.	Sk 160-SMC X-1	»	55
4'4.	HZ Her-Her X-1	»	57
4'5.	HD 77581-3U 0900—40	»	57
4'6.	HD 153919-3U 1700—37.	»	60

J. N. BAHCALL – Optical properties of binary X-ray sources.

1.	Introduction	»	63
2.	Astronomical techniques	»	65
2'1.	Spectroscopic classification	»	65
2'2.	Photometry: colors and magnitudes	»	66
2'3.	Reddening	»	67
2'4.	Infra-red measurements	»	67
2'5.	Polarization measurements	»	68
2'6.	Pulsations and flickering.	»	68
2'7.	Historical plates	»	68
2'8.	Mass function	»	69
3.	Observational preview and general considerations.	»	69
3'1.	Definition of the subject.	»	69
3'2.	The binary systems	»	70
3'3.	$L_{\text{opt}}/L_{\text{X}}$ and X-ray heating	»	70
4.	Cygnus X-1/HDE 226868.	»	71
4'1.	Identification	»	71
4'2.	Classification	»	71
4'3.	Spectroscopy	»	72
4'4.	Orbital period	»	73
4'5.	Mass function	»	73
4'6.	Colors	»	74
4'7.	Distance	»	74
4'8.	Mass of the secondary.	»	74
4'9.	Light variations	»	76
4'10.	Polarization	»	77
4'11.	Three-body models	»	77

5. Krzeminski's Star/Cen X-3	pag.	79
5'1. Identification	»	79
5'2. Spectroscopy	»	80
5'3. Photometry	»	80
5'4. Distance	»	81
5'5. Masses	»	81
6. Sanduleak 160/SMC X-1	»	82
6'1. Identification	»	82
6'2. Spectroscopy	»	82
6'3. Photometry	»	83
6'4. Distance	»	84
6'5. Masses	»	84
7. Hz Herculis/Her X-1	»	84
7'1. Identification	»	84
7'2. Spectroscopy	»	85
7'3. Light curve: general features	»	86
7'4. 35 day periodicity	»	88
7'5. Inactive-state variations	»	89
7'6. Period and phase	»	89
7'7. Flickering	»	89
7'8. Optical pulsation	»	90
7'9. Distance	»	91
7'10. Mass estimates	»	91
8. V 818 Sco/Sco X-1	»	91
8'1. Identification	»	91
8'2. Spectroscopy	»	92
8'3. Photometry	»	92
8'4. Periodicity	»	92
8'5. Distance	»	93
8'6. Models	»	93
8'7. Masses	»	93
9. Cygnus X-3	»	94
9'1. Identification	»	94
9'2. Infra-red observations	»	94
9'3. Optical and near-infra-red observations	»	95
9'4. Distance	»	96
9'5. Period	»	96
10. HD 77581/Vela XR-1 ($\equiv$ 3U 0900—40)	»	96
10'1. Identification	»	96
10'2. Classification	»	96
10'3. Spectroscopy	»	96
10'4. Magnitudes and colors	»	97
10'5. Distance	»	97
10'6. Photometric variations	»	98
10'7. Mass estimates	»	98
11. HD 153919/3U 1700—37	»	99
11'1. Identification	»	99
11'2. Spectroscopy	»	99

11'3. Photometry	pag. 100
11'4. Distance	» 100
11'5. Mass.	» 100
12. Crucial observations	» 101
12'1. Infra-red observations	» 101
12'2. Spectroscopy	» 101
12'3. Photoelectric monitoring.	» 102
12'4. Satellite UV observations	» 103
12'5. X-ray observations	» 103

P. E. BOYNTON – Hercules X-1: the clockwork wonder.

1. Introduction	» 111
2. 35 ^d evolution of the optical light curve	» 114
2'1. Observations	» 114
2'2. Time series analysis.	» 117
2'3. Harmonic analysis	» 119
2'4. Color analysis	» 121
3. Optical clues to the nature of accretion	» 123
4. Model calculations.	» 124
4'1. Defining the problems.	» 124
4'2. Possible underlying causes	» 125
4'3. Model light curves	» 131
5. The accretion disk.	» 134
6. Confronting the X-ray data	» 139
7. Epilog	» 146

G. W. CLARK – Recent results of X-ray observations from
OSO-7 and SAS-3.

1. Introduction	» 148
2. The X-ray sky	» 148
2'1. The X-ray sky survey	» 148
2'2. New glimpses from SAS-3; two new ultra-low-energy X-ray sources	» 151
3. X-ray sources in globular clusters.	» 152
4. Slow X-ray pulsars	» 156
5. Variability and position of the compact X-ray sources in Cen A	» 159
Appendix – Descriptions of the X-ray instruments on the OSO-7 and SAS-3	» 161
A'1. The MIT experiment on the OSO-7	» 161
A'2. The X-ray observatory on SAS-3.	» 161
A'2.1. Rotation modulation collimator detector (RMC)	» 161
A'2.2. Multigrid «slat» collimator detectors	» 163

A'2.3. Tubular collimator detectors pag. 163
A'2.4. Low-energy detector with parabolic reflection
concentrators » 163
A'2.5. Wide-angle detector » 163
A'2.6. Star trackers » 164
A'2.7. Control section » 164
A'2.8. Operations » 164

R. P. GIFFARD, S. P. BOUGHN, W. M. FAIRBANK, M. S. McASHAN, H. J. PAIK and R. C. TABER – Gravitational-wave detectors of increased sensitivity.

1. Introduction » 166
2. Sensitivity of resonant-mass detectors » 168
3. Comparison with the sensitivity of free-mass detectors » 171
4. Stanford-Louisiana State-Rome project » 173
5. Details of the Stanford 4800 kg detector. » 175

R. M. HJELLMING – Radioemission from compact X-ray sources.

1. Introduction » 185
2. The radiosphere » 186
3. Current status of radioemitting X-ray sources » 187
4. The SCO X-1 radio sources » 188
5. Cyg X-3, the « nano-quasar » » 191
6. Cyg X-1 alias HDE 226868 » 196
7. The energies and magnetic fields in radioemitting X-ray
sources » 198

J. B. HUTCHINGS – Optical observations of X-ray sources.

1. Basic models of X-ray binaries » 202
2. Discussion of individual sources. » 203
3. Mass transfer and X-radiation » 214

J. MIDDLEDITCH and J. NELSON – Optical pulsations from HZ Her-Her X-1: a determination of the mass of the neutron star.

1. Data collection and analysis » 216
2. Results » 217
3. Elementary binary kinematics and variables » 222
4. Reflection-reprocessing model » 223
5. Conclusions » 228

K. A. POUNDS – Observations of compact X-ray sources with the Ariel V sky survey experiment.

1. Introduction	pag. 230
2. Centaurus X-3	» 236
3. Vela X-1	» 239
4. Cygnus X-1	» 243
5. Bright X-ray novae	» 244

I. B. STRONG – Neutron stars, black holes and gamma-ray bursts.

1. Introduction	» 250
2. Instrumental effects	» 250
3. Known properties	» 251
4. Neutron star or black-hole origins	» 252
5. Discussion	» 254

H. TANANBAUM – Recent observations from Uhuru and ANS.

1. Introduction	» 256
2. Observations of time variability	» 258
3. Observations of spectra and discussion	» 279

THEORETICAL PAPERS

R. RUFFINI – Physics outside the horizon of a black hole.

1. Introduction	» 287
2. The Kerr-Newman black hole	» 291
3. Stability of black holes against small perturbations. . .	» 295
4. Orbits of test particles in the field of black holes . . .	» 300
5. Radiation processes in the field of black holes	» 306
6. The mass formula of black holes	» 319
7. Electromagnetic structures of an accreting black hole. .	» 326
8. On an analytic solution of magnetized plasma accreting into a black hole	» 335
9. Klein paradox and black-hole magnetospheres	» 342

W. D. ARNETT – The final stages of the evolution of single stars.

Introduction	» 356
1. Physics considerations	» 356
1.1. Nuclear reactions	» 356

1'2.	Neutrino processes	pag. 359
1'3.	Gravitational and nuclear binding energies	» 363
1'3.1.	Gravitational binding energy	» 363
1'3.2.	Electron degenerate configurations (white dwarfs)	» 364
1'3.3.	Neutron stars	» 364
1'4.	Some structural terminology	» 366
1'5.	Ignition masses	» 367
1'6.	Convective cores and shells	» 370
1'7.	Envelope mass loss	» 377
1'7.1.	Escape velocity	» 377
1'7.2.	Radiation-driven mass loss	» 378
1'7.3.	Shock waves from the convective zone	» 378
1'7.4.	Dimensional argument	» 378
1'7.5.	Pulsationally driven mass loss	» 378
1'7.6.	Planetary nebulae	» 379
1'8.	The degenerate Urca process	» 379
1'9.	Neutronization and thermal disintegration	» 381
1'9.1.	Method of calculation	» 382
1'9.2.	Accuracy	» 385
1'9.3.	Analytic approximations	» 387
1'10.	Electron pair instability	» 387
2.	Hydrostatic evolution	» 389
2'1.	Masses $M \leq 5$ to $7M_{\odot}$	» 389
2'1.1.	Observational estimates of M_L	» 390
2'1.2.	Evolution to $^{12}\text{C} + ^{12}\text{C}$ ignition	» 391
2'1.3.	Carbon burning and the degenerate Urca process	» 395
2'2.	Masses $M \geq 5$ to $7M_{\odot}$	» 402
2'2.1.	Introduction and method	» 403
2'2.2.	Characteristics of evolutionary stages	» 405
2'2.3.	Pre-supernova models	» 413
3.	Hydrodynamic evolution	» 416
3'1.	Carbon detonation (?)	» 416
3'2.	Pair instability explosions	» 422
3'3.	Core collapse	» 423
3'4.	Neutrino transport	» 426
3'4.1.	The mechanism for explosion	» 426
3'4.2.	The Weinberg angle and neutrino opacities	» 428
4.	Comments and conclusions	» 432

B. M. BARKER and R. F. O'CONNELL — General-relativistic effects in binary systems.

1.	Introduction	» 437
2.	The gravitational two-body problem with arbitrary masses and spins	» 438

3. Heuristic classical derivation of the spin-dependent terms in the gravitational interaction of two arbitrary masses pag. 442

4. Application to binary systems, particularly the binary pulsar PSR 1913+16 » 443

V. CANUTO – Neutron stars.

Introduction » 448

1. Quantizing magnetic fields » 448

1'1. » 448

1'2. The equation of state » 454

1'3. Neutron beta-decay » 456

1'4. Neutrino reactions » 458

1'5. Transport properties. » 464

1'6. Photon transport » 467

1'7. Lofer state » 469

1'8. Astrophysical applications » 472

2. The internal structure » 473

2'1. Introduction » 473

2'2. The internal constitution of a neutron star » 476

2'3. The central region » 481

2'4. The solid core » 489

2'5. The ultra-high-density regime » 493

2'6. Relativistic harmonic Lagrangians » 494

2'6.1. The mean-field approximation » 494

2'6.2. The perturbative approach. » 495

2'6.3. The Hagedorn-type formulations » 496

2'7. High-energy p-p collisions. The hydrodynamic model » 498

2'8. Astrophysical applications » 502

2'8.1. General consideration on the equation of state » 502

2'8.2. Results » 510

2'8.3. The moment of inertia » 514

2'9. Conclusions. » 514

Appendix A. - Pulsar. Neutron stars. Supernova explosion » 515

Appendix B. - Flux conservation » 518

Appendix C. - Gauge-invariant derivation of the equation of state for a strongly magnetized gas » 519

Appendix D. - Neutron beta-decay » 521

Appendix E. - Transport properties » 522

Appendix F. - Stability condition for a neutron star . . . » 524

S. CHANDRASEKHAR – On the linear perturbations of the Schwarzschild and the Kerr geometries.

1. The Schwarzschild geometry » 528

2. The Kerr geometry » 530

2'1. The elimination of m » 531

2'2. The $r_*(r)$ -relation	pag. 532
2'3. Electromagnetic perturbations	» 533
2'4. Concluding observations	» 537
S. A. COLGATE – Prompt gamma-rays and X-rays from supernovae	» 539
T. DAMOUR – Note on the spin precession effect in a rela- tivistic binary system	» 547
W. KUNDT – Radio wave propagation through the pulsar magnetosphere and wind zone	» 550
W. KUNDT – Pulsar irregularities and temperatures	» 552
E. T. NEWMAN – Rotation in general relativity.	
Lecture I	» 554
Lecture II	» 557
H. OKAMURA – Microscopic potential and macroscopic po- tential in gravitation theory.	
1. Newtonian potential	» 562
2. Post-Newtonian potentials	» 563
2'1. Potential in the order of G^2	» 563
2'2. Potential in the order of $G(v/c)^2$	» 564
3. Higher-order potential and apparent break-down of the correspondence principle	» 564
4. On the « spin-orbit interaction »	» 564
R. PENROSE – Gravitational collapse: a review.	
1. Introduction	» 566
2. Spherically symmetrical collapse	» 566
3. Asymmetrical collapse	» 572
4. The standard collapse picture.	» 575
5. The Kerr field	» 577
6. Hawking black-hole evaporation	» 579

L. PIETRONERO and R. RUFFINI – On the maximum mass of a neutron star.

1. Introduction	pag. 583
2. The critical mass of a neutron star	» 584
3. Variational method	» 586
4. Numerical results	» 590
5. Summary and conclusions	» 594

T. PIRAN and J. SHAHAM – Collisions in black-hole ergospheres and the Penrose process.

Introduction	» 597
1. General theory	» 599
1'1. The Penrose process	» 602
1'2. Particle orbits	» 603
1'3. The case of particle 3 formed and moving in the equatorial plane, in prograde motion, exterior to the isoenergy circular orbit	» 605
1'4. How well can one do with $E_{3\max}$ throughout the ergosphere	» 609
1'5. Collisions in the ergosphere	» 610
1'6. Multiple collisions in the ergosphere	» 612
1'7. Nonequatorial collisions and outgoing particles with $Q \neq 0$	» 614
2. Astrophysical layouts	» 615
2'1. a/M values	» 615
2'2. Collisions of large bodies	» 617
2'3. Particle collisions	» 617
2'4. Inverse Compton scattering and production of soft γ -rays	» 618
2'5. Scenario for γ -ray bursts	» 619
3. Conclusion	» 622

H. SATO – Gravitational field of spinning mass: Kerr metric and Tomimatsu-Sato metric.

1. Gravitational field about the spinning mass	» 624
2. Limits of the TS metric	» 626
2'1. Weak-field limit	» 626
2'2. The $q=1$ limit	» 627
3. Naked ring singularity and event horizon	» 628
3'1. $g_{tt}=0$ surface	» 628
3'2. Ring singularity	» 628
3'3. Closed timelike lines	» 629
3'4. $x^2=1$ surface	» 629

4. Geodesics	pag. 631
4'1. Null geodesics	» 631
4'2. Timelike geodesics	» 632
5. Solutions of Einstein-Maxwell field equation	» 633

S. TSURUTA – Cooling and heating of neutron stars. Current status.

Introduction	» 635
1. Results	» 635
1'1. No magnetic fields, no superfluidity, no accretion	» 635
1'2. With magnetic fields and superfluidity but no accretion	» 636
1'2.1. No magnetic condensation	» 636
1'2.2. With magnetic condensation	» 638
1'3. With accretion	» 639
1'3.1. Isolated neutron stars	» 639
1'3.2. Binary X-ray sources	» 639
2. Discussion	» 640
2'1. Recent developments	» 640
2'1.1. Neutral currents	» 640
2'1.2. Plasticity, noise, etc.	» 640
2'1.3. Gravitational waves	» 640
2'2. Observational significance	» 640
2'2.1. The Crab pulsar	» 640
2'2.2. Older pulsars	» 641
2'2.3. X-ray sources	» 641
3. Conclusion	» 641

J. R. WILSON – A numerical study of rotating relativistic stars.

1. Introduction	» 644
2. Equations.	» 645
3. Method of solution	» 650
4. Results for equilibrium configurations	» 652
5. Results of dynamic calculations.	» 663
Appendix. - Nonaxisymmetric instabilities	» 673

J. R. WILSON – Neutrino flow and gravitational collapse.

1. Introduction	» 676
2. Details of model	» 677
2'1. Equation of state	» 677
2'2. Neutrino flow model	» 680
3. Results of the calculations	» 684
4. Conclusions	» 692

PHENOMENOLOGICAL PAPERS

R. A. SUNYAEV – Theory of accretion.

1. Introduction	pag. 697
2. Introductory remarks	» 697
2'1. Energy release due to accretion	» 697
2'2. Radiation mechanisms.	» 698
2'3. Eddington critical luminosity	» 704
3. What do we see?	» 706
3'1. X-ray pulsators.	» 706
3'2. Optical evidence of the existence of binary X-ray systems	» 707
3'3. Observational properties of accreting discs in optical wavelengths	» 709
3'3.1. X-ray capture by the outer regions of the disc	» 714
3'3.2. The contribution of disc and « hot spot » to the optical brightness of a system	» 716
3'3.3. Comparison of theory and observational data	» 717
3'4. Interaction of the X-rays with the atmosphere of a normal star	» 719
Reflection of X-rays	» 719
Induced stellar wind	» 722
3'5. Transient sources	» 722
3'6. Sources of X-ray bursts: bursters	» 722
4. Basic types of accretion flows	» 723
4'1. Binary stellar system	» 723
4'2. Specific angular momentum of the captured stellar-wind matter	» 725
4'3. Condition for the realization of the disc accretion	» 726
4'4. Interstellar matter	» 727
5. Spherically symmetric problem of accretion	» 728
5'1. Free fall of noninteracting particles.	» 728
5'2. Gasdynamic problem. Bondi solution.	» 731
5'3. Basic elementary processes in the accretion flow with $\gamma = \frac{5}{3}$	» 736
Bremsstrahlung energy losses.	» 739
Line cooling	» 740
Compton heating and cooling	» 742
Gamma-radiation in the case of spherically symmetric accretion	» 742
6. Accretion of the stellar wind	» 743
6'1. Capture of the stellar wind	» 743
6'2. Effect of X-ray source radiation on the stellar wind	» 745
6'2.1. Structure of an accretion cone	» 747
Pressure within the cone	» 750
Energy release in the cone	» 751
Lower boundary of the cone.	» 752

6'2.2. Nonstationary accretion of stellar wind . . .	pag. 753
Sufficiently high $\dot{\mu}$; transient sources	» 754
High V and $\dot{\mu}$. Rapid bursts	» 755
Small $\dot{\mu}$ and V_0 ; bursters	» 757
Approximate solution for an expanding en- velope	» 757
Cooling effects	» 760

G. BÖRNER, F. MEYER, H. U. SCHMIDT and H.-C. THOMAS –
Some aspects of the binary system of HZ Her and Her X-1.

1. Introduction	» 764
2. A model for the disk	» 764
3. The magnetospheric valve	» 766
4. The long-term on-off cycle of HZ Her	» 767
5. The 35 day cycle	» 769

M. FUJIMOTO and T. MURAI – An interpretation of the phe-
nomenon of drifting subpulses from pulsars » 771

J. HEISE, A. C. BRINKMAN, R. MEWE, A. J. F. DEN BOG-
GENDE, E. H. B. M. GRONENSCHILD and J. SCHRIJVER –
X-ray observations with the astronomical Netherlands
satellite ANS.

1. Instruments	» 774
2. Soft-X-ray observations	» 775
Coronae of stars	» 775
Dwarf novae	» 778
Flare stars	» 780
3. Some results on compact stars	» 780

A. P. LIGHTMAN, S. L. SHAPIRO and M. J. REES – Accretion
onto compact objects.

1. Introduction	» 786
2. Accretion onto black holes	» 786
2'1. Spherical accretion onto black holes	» 786
2'2. Binary systems and disk accretion	» 791
2'2.1. Modes of mass transfer and formation of disks	» 791
Rochelobe overflow	» 792
Stellar wind	» 793

2'2.2. General theory of steady Newtonian accretion disks	pag. 794
2'2.3. Viscosity in disks	» 797
2'2.4. Radiative transfer in accretion disks	» 798
2'2.5. Time-dependent disks, instabilities and rapid variability	» 801
2'2.6. Relativistic effects	» 802
2'2.7. Polarization of X-rays from disks	» 803
2'2.8. Areas of uncertainty	» 805
2'2.9. Observations of Cyg X-1	» 806
2'2.10. The two-temperature hot-disk model	» 807
2'3. Outline of accretion onto black holes	» 811
Spherical accretion onto black holes	» 811
Disk accretion onto black holes	» 813
3. Accretion onto neutron stars	» 816
3'1. Inflow across the Alfvén surface	» 816
3'2. Spin up or spin down?	» 817
3'3. Emission from accreting neutron stars	» 817
3'4. The Eddington limit	» 821
4. Accretion onto white dwarfs	» 824

E. P. J. VAN DEN HEUVEL – Evolution of close binaries,
with possible applications to massive X-ray binaries.

1. Introduction	» 828
2. Evolution of single stars during hydrogen and helium burning	» 831
2'1. Time scales of stellar evolution	» 831
2'2. The evolution of single stars of various masses	» 831
Massive stars	» 833
Low-mass stars	» 833
3. The evolution of close binaries	» 834
3'1. The Algol paradox	» 834
3'2. The Roche lobe and its importance	» 835
3'3. Different types of evolution of close binaries; the importance of case <i>B</i> evolution	» 835
3'4. The reasons for the occurrence of extensive mass exchange	» 836
3'5. Results of mass exchange in cases <i>A</i> and <i>B</i>	» 838
3'6. Comparison with the observations; Wolf-Rayet binaries	» 843
3'7. The final evolution of close binaries; the evolution of helium stars	» 843
3'7.1. Types of remnants of the primaries	» 843
3'7.2. The effects of the supernova explosion on the orbit	» 846

3'8. Evolution of the system after the supernova explosion of the primary—the X-ray binary stage pag. 848

3'9. Expected numbers of massive binaries with one collapsed component in the Galaxy » 852

3'9.1. Rough estimates based on the observed number of massive X-ray binaries » 852

3'9.2. Theoretically predicted numbers of massive X-ray binaries and other evolved massive close binaries in the Galaxy » 853

3'10. Discussion and summary concerning the evolutionary scenario for massive X-ray binaries. » 855

4. Nonconservative evolution of close binaries » 857

4'1. Break-down of the « conservative » assumptions . . » 857

4'2. Rough estimate of the results of spiralling-in . . . » 858

4'3. Appearance of the system after spiralling-in. . . . » 860

4'4. Evolution of the system after spiralling-in » 860

4'5. Possible scenarios for the origin of Hercules X-1 system. » 861

4'6. Alternative scenario for Her X-1; implosion of a massive white dwarf » 862

4'7. Discussion; rareness of the formation of systems like Hercules X-1 » 863

Appendix. - Stellar winds and accretion in massive X-ray binaries. » 863

A'1. The accretion rate S_a » 866
