

**VOLUME I: SOLAR AND SOLAR WIND PLASMA PHYSICS**

Introduction	v
Contents	ix
<b>Section 1: Solar plasma physics</b>	
I.1.1 E.N. Parker et al. <i>A broad look at solar physics</i>	3
I.1.2 D.M. Rust <i>Solar flares</i>	51
<b>Section 2: The solar wind</b>	
I.2.1 T.E. Holzer <i>The solar wind and related astrophysical phenomena</i>	101
I.2.2 L.A. Fisk <i>The interactions of energetic particles with the solar wind</i>	177
I.2.3 A. Barnes <i>Hydromagnetic waves and turbulence in the solar wind</i>	249
I.2.4 W.C. Feldman <i>Kinetic processes in the solar wind</i>	321
Author index	xi
Subject index	xxix

**VOLUME II: MAGNETOSPHERES**

# Contents

1. Introduction	5
2. The role of solar physics	7
2.1. Introduction	7
2.2. Basic mechanisms in solar physics	7
2.3. Diagnostics	10
2.4. Instrumentation	12
2.5. Solar–terrestrial relations	12
2.6. Interplanetary medium	13
3. Solar research – progress and prospects	13
3.1. Introduction	13
3.2. Solar flares and high-energy phenomena	13
3.3. Solar active regions	18
3.4. Solar interior, convection, and activity	22
3.5. Structure and energetics of the quiet solar atmosphere	23
3.6. Structure of the corona	24
3.7. Solar wind	26
3.8. Solar composition	28
3.9. Solar–terrestrial interactions	29
4. Proposed solar research	33
4.1. Introduction	33
4.2. Flares	33
4.3. The active sun	38
4.4. The quiet sun	40
4.5. Solar interior, convection, and long-term variability	43
4.6. Coronal and interplanetary research	44
4.7. Solar–terrestrial effects	45
References	49

# Contents

1. Introduction	53
1.1. Flares and plasma physics	53
1.2. Flare emissions	53
1.3. Literature	62
2. The preflare state	62
2.1. Magnetic fields	63
2.2. Skylab observations of flare precursors	69
3. Energy release	70
3.1. Impulsive phase energy release	70
3.2. Production of solar cosmic rays	78
3.3. Electron beams	79
3.4. Main phase energy release	79
3.5. Post main-phase energy release	81
3.6. Overview of energy release	84
4. Flare models	84
4.1. Emerging flux model	84
4.2. Difficulties	88
4.3. Unstable loop model	90
4.4. Conclusions	92
References	93

# Contents

1. Introduction	103
2. Basic equations	103
3. Solar wind	105
3.1. Coronal expansion	105
3.2. Development of solar wind structures	120
3.3. Chemical composition and ionization state	138
3.4. The transport of angular momentum	144
3.5. Interaction with the interstellar medium	144
3.6. History and evolution	154
4. Related astrophysical phenomena	155
4.1. Stellar winds	155
4.2. Related flows	162
4.3. Development of astrophysical structures	164
4.4. Elemental abundances and ionization state	165
5. Summary	165
5.1. The solar wind	165
5.2. Related astrophysical phenomena	167
6. Timetable for solar wind research	167
References	169

# Contents

1. Introduction	179
2. Modulation theory	181
2.1. Introduction	181
2.2. The basic idea	182
2.3. The modulation equations	185
2.4. Energy loss	187
2.5. Solving the modulation equations	190
2.6. Techniques of modulation theory	190
2.7. Successes of modulation theory	193
2.8. Challenges to current modulation theory	198
2.9. Concluding remarks	211
3. Propagation theory	212
3.1. Introduction	212
3.2. Quasi-linear theory	213
3.3. Nonlinear corrections	219
3.4. Comparison with the observations	220
3.5. Further considerations	224
3.6. Cross-field diffusion	226
3.7. Concluding remarks	228
4. Acceleration theory	229
4.1. Introduction	229
4.2. The observations	230
4.3. Statistical acceleration	231
4.4. Acceleration at shock fronts	235
4.5. Acceleration of interstellar ions	237
4.6. Concluding remarks	238
5. Some comments on research in the coming years	238
5.1. Immediate efforts	238
5.2. Long-range efforts	240
References	241

# Contents

1. Introduction	251
2. Solar-wind plasma parameters	253
3. Local MHD theory of hydromagnetic fluctuations	255
3.1. Nonpropagating structures ( $\psi_t + V_z \psi_z = 0$ )	256
3.2. Transverse Alfvén wave (or intermediate wave)	257
3.3. Magnetoacoustic waves	257
3.4. Small-amplitude limit	258
3.5. Nonplanar Alfvén waves	260
4. Local kinetic theory of hydromagnetic fluctuations	260
4.1. MHD analogy	260
4.2. Kinetic theory of transverse Alfvén waves	263
4.3. Kinetic theory of stationary structures	265
4.4. Kinetic theory of small-amplitude hydromagnetic waves	265
4.5. Physical mechanism of magnetoacoustic wave dissipation	273
4.6. Large-amplitude collisionless magnetoacoustic waves and related topics of non-linear theory	275
5. Observed hydromagnetic fluctuations and their interpretation	280
5.1. Hydromagnetic waves	280
5.2. Turbulence spectra	285
5.3. Discontinuities	287
6. Convection and propagation of waves in the solar wind	289
7. Origins of interplanetary fluctuations	296
8. Interaction of waves with the solar wind	299
9. Hydromagnetic waves in astrophysics	304
10. Summary and recommendations	306
References	310

# Contents

1. Introduction	323
2. Particle velocity distributions in the solar wind near 1 AU	325
2.1. Electrons	325
2.2. Protons	328
2.3. Alpha particles	329
3. The regulation of solar wind heat flux near 1 AU	329
4. Type III radio emission	333
5. Ion beam regulation	335
6. In situ acceleration of energetic particles	337
7. Summary and suggested future research	339
