

CONTENTS

Introduction to the Series	ix
Preface	xi
Chapter 1. Cosmic Plasma in Typical Conditions	1
1.1. The basic equations of cosmic electrodynamics	1
1.2. The specific properties of cosmic fields	11
1.3. The most widespread magnetic configuration	16
1.4. Magnetic fields in a moving plasma	20
1.5. Plasma as a continuous medium (the Lagrangian approach)	23
1.6. Currents in a cosmic plasma	28
Chapter 2. Excited States of the Cosmic Plasma	31
2.1. Plain waves in magnetohydrodynamics	31
2.2. Linear modes and their properties	37
2.3. Damping of MHD waves	41
2.4. MHD waves in collisionless plasmas	43
2.5. Strong MHD discontinuities and their classification	47
2.6. Shock waves	50
2.7. Plasma instabilities	54
2.8. Turbulent cosmic plasma	58
2.9. Current sheets	60
Chapter 3. The Weak Field Approximation and Kinematic Dynamo	65
3.1. Decreasing the scale of the field	65
3.2. Formulation of the problem of a kinematic dynamo	68
3.3. Dynamo theory	70
3.4. Construction of dynamo models	72
3.5. Successes and difficulties of laminar dynamo models	373

Chapter 4. The Turbulent Dynamo	81
4.1. Basic information about turbulence	81
4.2. Non-conventional turbulence	84
4.3. New conceptions on the nature of turbulence	90
4.4. The Lagrangian description of turbulence	92
4.5. Kinetic equations	94
4.6. The generalized Kolmogorov–Fokker–Planck equations and the theory of turbulence	96
4.7. Multi-particle distribution functions and intermittency	98
4.8. Dynamics of the magnetic field: rapid dissipation	100
4.9. The equations for the magnetic field	101
4.10. The turbulent dynamo of small-scale fields	103
4.11. Small-scale fields in cosmic conditions	106
4.12. Large-scale fields: kinematics	110
4.13. Large-scale fields: macroscopic MHD	113
4.14. Intermediate-scale fields: edge effects	115
Chapter 5. Topological Nonequilibrium of Magnetic Fields and Current Sheets	123
5.1. Problems arising in a simplified approach to the current-sheets formation	123
5.2. Magnetic zero points and field line reconnection	128
5.3. Topological nonequilibrium (magnetic nonequilibrium): toroidal fields	129
5.4. Basic features of plasma equilibrium in the presence of zero lines	132
5.5. Loss of equilibrium in elongated magnetic configurations	135
5.6. Force-free fields	139
5.7. Force-free fields: loss of equilibrium	142
5.8. Topological nonvariance	147
5.9. Dynamics of magnetic clouds and plasmoids in the solar wind	149
5.10. Equilibrium of twisted magnetic tubes: the role of the longitudinal field	154
5.11. Merging of magnetic islands	157
5.12. Magnetic fields in a stratified medium: taking account of gravity	163
Chapter 6. Current-Sheets Formation	167
6.1. Equilibrium loss and instability	167
6.2. Direction of the reconnecting process	169
6.3. Instabilities and loss of equilibrium in astrophysics	173
6.4. Rate of reconnection	177
6.5. Quasistationary current sheets and energy accumulation	181
6.6. Current sheets and plasma turbulence	184
6.7. MHD turbulence and current sheets	186

6.8. Synergetic properties	187
6.9. Current sheet modeling	189
6.10. Modes of current sheet formation. Classification	191
Chapter 7. Solar Magnetohydrodynamics	195
7.1. Mixing of the solar interior	195
7.2. Convection zone: differential rotation	196
7.3. Convection zone: dynamo	200
7.4. Galaxies, stars and all that	206
7.5. The nature of magnetic fields in the solar photosphere	208
7.6. Superfine structure	211
7.7. Spicules and surges. X-ray bright points	217
7.8. Solar flare theory	218
7.9. Open and closed configurations. Transients	223
7.10. Solar prominences	224
Chapter 8. Nonlinear Waves in Plasmas	231
8.1. The Burgers equation	231
8.2. The structure of parallel shock waves	233
8.3. The structure of perpendicular shock waves	236
8.4. The role of dispersion. The KdV–Burgers equation	237
8.5. Periodic nonlinear waves and solitons in a cold plasma	241
8.6. The oscillatory structure of dissipative shock waves	245
8.7. Nonlinear waves in a hot plasma. The derivative nonlinear Schrödinger equation	248
8.8. Stationary nonlinear waves in a hot plasma	253
8.9. Two- and three-dimensional solitons. Nonlinear waves stability problems	257
8.10. Collisionless shock waves. Models of collisionless shock waves	259
Chapter 9. Generation and Propagation of Nonlinear Waves	263
9.1. Evolution of nonlinear perturbations and soliton generation	263
9.2. Generation and propagation of shock waves. Self-similar and asymptotical solutions	272
9.3. Shock-wave interaction with weak and strong inhomogeneities	284
9.4. Shock-wave propagation in randomly inhomogeneous medium	289
9.5. Shock waves and turbulence in the interplanetary medium	293
9.6. Additional references for chapter 9	299
Chapter 10. Shock Waves and the Dynamics of the Interstellar Medium	301
10.1. Structure of the interstellar medium	301
10.2. Sources of shock waves in the Galaxy	306
10.3. The distribution function for interstellar shock waves	309

10.4. Shock-wave turbulence in the ISM	315
10.5. Formation of vortex and acoustic turbulence by shock waves	319
10.6. Additional references for chapter 10	325
Chapter 11. Acceleration and Transfer of Charged Particles by Large-Scale Turbulence and MHD Shock Ensembles	327
11.1. The role of cosmic rays in ISM dynamics	327
11.2. Transport and acceleration of charged particles by weak long-wavelength turbulence	329
11.3. Renormalization of the kinetic coefficients for systems with strong long-wavelength turbulence	333
11.4. The kinetics of strong particle acceleration over the correlation scale	336
11.5. The acceleration of particles near a shock front, and the effect of accelerated particles on shock-wave structure	340
11.6. Acceleration and transport of particles by MHD shock-wave ensembles. Accelerated particle spectra	347
11.7. Charged-particle diffusion across the mean magnetic field	361
References	367
Index	395
