VOLUME I

PART I. THE OBSERVED PHENOMENA OF GEOMAGNETISM

INTRODUCTION TO PART I	xxix
I. GENERAL PRINCIPLES	1
1. Magnetic elements	1
2. Intrinsic and relative elements	3
3. Magnetic intensity units	3
4. The potential due to a magnetic pole	4
5. Compound magnetic fields	6
6. Mean fields and variation fields	7
7. Laplace's equation	8
8. Equipotential surfaces and lines of force	8
9. The 'elementary' magnet or dipole	10
10. The mechanical couple and force on a dipole in a magnetic field	11
11. The oscillation of a magnet in a magnetic field	13
12. The deflexion of a magnet by another magnet	14
13. The magnetic field due to an electric current-circuit	15
14. Intensity of magnetization	19
15. The field of a uniformly magnetized sphere	20
16. The magnetic induction (B) inside a magnetized body	22
17. Permanent and induced magnetization	23
18. Electromagnetic induction	26
II. MAGNETIC OBSERVATIONS	29
A. PRINCIPLES AND ORGANIZATION OF MEASUREMENTS	29
1. Accurate measurement of a weak magnetic field	29
2. Magnetic observatories	30
3. Absolute observations of direction: declination and dip	31
4. The magnetic method of measuring the horizontal intensity H	35
5. Electrical methods for measuring magnetic intensities	39
6. Survey measurements on land	42
7. Survey measurements at sea	44
8. The secular magnetic variation	47
9. Continuous magnetic registration	48
10. Quick-run magnetographs of Schmidt and La Cour	56
11. Measurements of rate of time-change	57
12. The accuracy of magnetic observations	60
13. Time-reckoning in magnetic observatories	60
14. Data published by magnetic observatories	61

15. The harmonic expression of daily inequalities	63
16. Variables of position used in the description of the earth's magnetic field	64
17. International co-operation in geomagnetism, and the International Polar Years	65
18. The Department of Terrestrial Magnetism (Carnegie Institution of Washington)	67
19. Stereoscopic drawings	68
20. Special pantographs	69
B. SOME DETAILS OF MAGNETIC MEASUREMENTS	70
21. The parameters of a magnet	70
22. The regular magnet	71
23. The schematic magnet	73
24. Equivalent magnetic distributions	74
25. The mutual potential energy of two dipoles	74
26. The mutual force between two dipoles or magnets	75
27. The couple exerted by one dipole or magnet upon another	76
28. The interaction of two magnets, general expression	77
29. Deflecting bar and needle in selected positions	78
30. The deflexion constant	79
31. Influence of temperature, induction, and ageing	80
32. Oscillations	81
33. Final formulae for the measurement of H	82
34. Coil systems	83
35. The general theory of variometers	85
36. Types of variometers	89
37. The quartz horizontal-force magnetometer (QHM)	90
38. The magnetron	93
39. Magnetic gradiometers	94
40. Non-magnetic material for magnetic instruments	95
III. THE EARTH'S MAIN FIELD AND ITS SECULAR VARIATION	96
1. Isomagnetic charts	96
2. Lines of horizontal force	102
3. The surface field of a uniformly magnetized sphere	103
4. The general character of the earth's field	104
5. Regional and local anomalies	105
6. Line integrals of horizontal magnetic force	110
7. Earth-air currents	112
8. Secular variation: isopic charts	113
9. Long series of secular variation observations	129
10. Secular variation as a regional phenomenon	130
11. Effect of the sunspot cycle on the secular variation. Normal values and secular values	133
12. Indirect inferences concerning the secular variation	133

IV. MAGNETISM AND GEOLOGY. MAGNETIC PROSPECTING	137
1. The purpose of magnetic prospecting	137
2. Local variometers	137
3. Schmidt's field balances	138
4. Technique of measurements with local variometers	139
5. The reduction and representation of the observations	140
6. The determination of the magnetic properties of minerals and rocks	141
7. The magnetic properties of some materials	144
8. The general connexion between geological structure and magnetic anomalies	145
9. The technique of magnetic prospecting	146
10. Methods for calculating the field of magnetized bodies	149
11. Examples of local magnetic anomalies	150
12. Induced or remanent rock magnetism ?	154
13. Relations of magnetic to other geophysical prospecting methods	157
V. SOLAR AND LUNAR DATA	159
1. The earth's orbital motion	159
2. The month and the lunar day	162
3. Phenomena on the sun's surface	165, 193
4. The sun's rotation	168
5. The 11-year sunspot cycle	173
6. Regions of long-continuing solar activity	177
7. The life-history of large sunspot groups	182
8. Sunspot magnetic fields	183
9. The distribution and periodicity of prominences	186
10. Periodic changes in the corona	186
11. The distribution and frequency of faculae	188
12. Solar physics	190
13. The sun's general magnetic field	191
14. Sources of solar data	192
VI. A GENERAL REVIEW OF THE TRANSIENT MAGNETIC VARIATIONS	194
1. The transient magnetic variations, S, L, and D	194
2. The magnetic classification of days	195, 213
3. World-wide simultaneity of magnetic activity	197
4. The geographical distribution of the average intensity of magnetic activity	198
5. The time-pattern of occurrence of magnetic disturbance	199
6. The general character of a great magnetic disturbance	200
7. The solar daily magnetic variations on quiet days	200
8. The S_D field	201
9. The disturbance field D	202
10. The annual variation of the magnetic field	203
11. A conventional subdivision of the transient variations	203
12. Relations of magnetic to meteorological phenomena	204
13. Examples of magnetic records	204

VII. THE SOLAR DAILY VARIATION ON QUIET DAYS, S_q	214
1. Geographical distribution and seasonal changes	214
2. Vector diagrams	214
3. The increase of amplitude of S_q with the sunspot number	220
4. Wolf's suggested linear relationship	224
5. The harmonic analysis of S_q	225
6. Representation of S_q by overhead current-systems	228
7. The approximate determination of the current in overhead circuits	232
8. Day-to-day changes of intensity of S_q	234
9. Hasegawa's discussion of S_q variability	238
10. The large daily variation of horizontal intensity at Huancayo	242
11. The zonal part of the S_q field	242
VIII. THE LUNAR DAILY MAGNETIC VARIATION L	244
1. The computation of L	244
2. The average L for a full lunation	245
3. The change of L with the moon's phases	245
4. Moos's expression for the change of L in the course of a lunation	247
5. Chapman's expression for L ; the phase-law	247
6. Chambers's luni-solar variation	249
7. The calculation of L for different transit times	250
8. L in Greenwich declination	250
9. Horizontal vector diagrams for L	250
10. Subdivisions of the data for L	253
11. The influence upon L of changes in lunar distance	253
12. The influence of the magnetic activity upon L	254
13. The influence upon L of the sunspot number	257
14. The seasonal change of L	261
15. The ionospheric current-systems for L	261
16. L in Huancayo H	261
17. van der Stok's method	267
18. The influence of the exclusion of disturbed hours	268
19. Other lunar geomagnetic effects	270
20. Newer methods for the determination of L	270
IX. THE MORPHOLOGY OF MAGNETIC DISTURBANCE	272
1. Separation of the storm-time and the disturbance-daily variations	272
2. The storm-time variation	275
3. The disturbance-daily variation S_D	277
4. The disturbance-daily variation for slight and intense disturbance	282
5. The storm-time variation for slight and intense disturbance	282
Disturbance in high latitudes (§§ 6-9)	285
6. Storm-time changes in high latitudes	285
7. Disturbance-daily variation in high latitudes	288
8. Summary of the average characteristics of disturbance in polar regions	290
9. Evidence in S_D for a shift of the auroral zone	291

10. The average disturbing vector during storms	292
11. The initial impulse in sudden commencements	296
12. Symmetrical-zonal and asymmetrical features of disturbance	299
13. A current-system corresponding to the D field	300
14. The S_D current-system	301
15. The storm-time current-system	307
16. The combined D current-system	309
17. Some details of individual magnetic storms. Schmidt's vortices	311
18. Rotational changes of the magnetic vector during storms	314
19. Birkeland's first memoir	317
20. Birkeland's classification of magnetic storms	321
21. Discussion of Birkeland's classification of magnetic storms	326
22. Remarkable magnetic storms	328
23. Some historical magnetic observations	332
24. Simultaneity of commencement of magnetic storms	335
X. BAYS, PULSATIONS, AND MINOR DISTURBANCES	338
1. Bays	338
2. Repetitions on consecutive days	340
3. Magnetic effects connected with solar chromospheric eruptions and radio absorption fadings	341
4. Micropulsations observed with ordinary magnetograms	349
5. Pulsations on quick-run magnetograms	352
6. Rapid vibrations	353
7. Pulsations recorded by induction and otherwise	353
8. Magnetic effects during solar eclipses	354
XI. MAGNETIC DISTURBANCE: STATISTICS AND SOLAR RELATIONSHIPS	355
1. Statistics in physics and geophysics	355
2. The daily ranges of the disturbance-field in Greenwich declination	356
3. The frequency and averages of these ranges	357
4. The numerical magnetic character	361
5. The Tromsø measure of storminess, and similar measures of magnetic activity	362
6. The u -measure of magnetic activity	363
7. A statistical aspect of measures of activity	365
8. The u_1 -measure	365
9. The annual variation of magnetic activity	365
10. Correlation	367
11. Correlations between annual means of magnetic and solar activity	370
12. Correlations between monthly means	372
13. Disturbance statistics at individual stations	374
14. Disturbance statistics at polar stations	375
15. The lack of general correlation between the sunspot numbers and the magnetic activity on individual days	376
16. Large magnetic storms and large sunspots	378
17. Spectrohelioscopic observations, individual cases	381, 395

18. Statistical comparisons of sunspots and magnetic activity by the 'superposed-epoch method'	382
19. The daily variation of magnetic activity	384
20. The dependence of the interdiurnal variability U on the initial hour of the day	389
21. Magnetic effects simultaneous with radio fade-outs	392
22. Further statistical aspects of measures of activity	393
23. Relation to comets	394
XII. THE 27-DAY RECURRENCE-TENDENCY IN MAGNETIC CONDITIONS	396
1. Results of the superposed-epoch method	396
2. The recurrence of geomagnetic storms	400
3. Lack of recurrence for the most intense storms	405
4. The 27-day time-pattern	407
5. The time-pattern for international magnetic character-figures 1906-33	407
6. Comparison of the 27-day time-patterns in magnetic and solar activity	410
7. Solar M -regions	410
8. Twenty-seven-day recurrences in other terrestrial phenomena	410
9. The geometry and width of solar streams of corpuscles	412
10. Indication of 30-day recurrence in great storms	416
XIII. EARTH-CURRENTS	417
1. Introduction	417
2. Earth-resistivity, homogeneous soil	418
3. Inhomogeneous soil	419
4. The apparatus of Gish and Rooney	421
5. Other methods	422
6. The general results of earth-resistivity surveys	423
7. Examples of resistivity surveys	424
8. Earth-current observatories	427
9. The earth-current measuring system	428
10. The earth-current components	430
11. The average earth-current	431
12. Spontaneous polarization	432
13. The problem of vertical earth-currents	433
14. The general character and magnitude of earth-current variations	434
15. Earth-current storms	435
16. Daily variations	437
17. Physical relations between terrestrial magnetism and earth-currents	439
18. Electric currents induced in moving water	445
XIV. THE AURORA POLARIS	449
1. General appearance	449
2. The available observations	454
3. The classification of auroral forms	454
4. The height of the aurora—early observations	457

5. Photographic measurements	458
6. Programmes of auroral observation	465
7. Low aurora and auroral sounds	466
8. Geographical distribution	467
9. Periods, and connexion with magnetic disturbances	471
10. Observations of the auroral spectrum	476
11. The nitrogen bands	477
12. The green line and other atomic lines of oxygen and nitrogen	478
13. The non-polar aurora	481
14. Variations in the auroral spectrum	482
15. The air-temperature at auroral levels	483
16. Relations between cosmic rays and terrestrial magnetism	483
XV. THE EARTH'S ATMOSPHERE	487
1. Troposphere and stratosphere	487
2. Pressure, density, and temperature	488
3. The composition of the upper atmosphere	493
4. Spectroscopic indications of the constitution	496
5. The <i>E</i> and <i>F</i> layers of the ionosphere	498
6. Ion-production by absorption of monochromatic light	504
7. The distribution and variations of ion-density	512
8. Electron-densities: comparison of observation with the simple theory	518
9. The atmospheric temperature, the mean free path, and the collision frequency	527
10. The spiral motion of charges in the upper atmosphere	531
11. The electrical conductivity of the upper atmosphere transverse to the magnetic field	535
12. Atmospheric motions	538
