

CONTENTS

PREFACE	<i>page xi</i>
1. Introduction	
1.1 Purpose of the book	1
1.2 Plan of the book	1
1.3 Bibliography	2
1.4 History	2
1.5 Nomenclature	5
PART I. THE DERIVATION OF THE EQUATIONS	
2. The macroscopic approach. Derivation of Appleton's equations by means of an equivalent continuous medium	
2.1 The equivalent continuous magneto-ionic medium	8
2.2 A wave in a continuous medium of dielectric constant ϵ	11
2.3 Waves in a medium which is electrically non-isotropic. Characteristic waves	12
2.4 The constitutive relations for a magneto-ionic medium	14
2.5 The characteristic waves in the magneto-ionic medium	16
2.6 The effects of collisions	18
3. The microscopic approach. The physical reason for the characteristic waves and their dispersion	
3.1 The microscopic explanation of dispersion	20
3.2 The wave scattered from an element of volume	22
3.3 Scattering from a thin slab	22
3.4 Effect of a thin slab of polarisable material on waves passing normally through it	25
3.5 Propagation through a continuous medium when the polarisability may be large. Fundamental concepts	26
3.6 Calculation of the self-consistent wave	27
3.7 Discussion of the self-consistent wave	29
3.8 The characteristic waves of the magneto-ionic theory	29

4. Absorption on the 'macroscopic' theory

4.1	Introduction	<i>page</i> 31
4.2	The frequency of collision of an electron with heavy particles	31
4.3	The average effect of collisions on the motion of an electron	35
4.4	The absorption coefficient in the magneto-ionic theory	37

5. The microscopic picture of absorption

5.1	Introduction	40
5.2	Absorption in terms of energy-transfer	40
5.3	Extension to the case where a magnetic field is present (longitudinal case)	44
5.4	Absorption in terms of re-radiation from individual electrons	45

PART II. INTERPRETATION OF THE EQUATIONS

6. Graphical representation when there are no collisions

6.1	No imposed magnetic field	53
6.2	The longitudinal case	54
6.3	The transverse case	56
6.4	The general case (Y less than unity, e.g. $Y = \frac{1}{2}$)	58
6.5	The general case (Y greater than unity, e.g. $Y = 2$)	61
6.6	Ordinary and Extraordinary waves	63

7. The polarisations of the waves

7.1	Introduction	65
7.2	The parameter ω_c and the polarisation when $X = 1$	66
7.3	Ordinary and Extraordinary waves and the choice of sign in the equations	69
7.4	Curves of $R(X)$	71
7.5	Limiting polarisation	74

8. The quasi-longitudinal (QL) and quasi-transverse (QT) approximations

8.1	The approximations	page 75
8.2	Conditions which satisfy the approximations when $X = 1$	76
8.3	The two approximations when $X \neq 1$	77
	(a) The QT approximation	77
	(b) The QL approximation	78
8.4	The QL and QT regions in a model ionosphere	78
8.5	The relation between the QL expression and that for the case of no applied field	80

9. The effect of collisions on the curves for μ and χ

9.1	Introduction	81
9.2	Curves for $\mu^2(X)$ and $\chi^2(X)$ (general)	81
9.3	The detailed changes of μ and χ	86
	(a) The curves for $\mu^2(X)$	86
	(b) The curves for $\chi^2(X)$	87
9.4	Approximations for small values of Z , and the conditions for reflection	87
9.5	Conditions for reflection when $Z^2 \gg 1$ at $X = 1$	89
9.6	Results for the QL approximation	90
9.7	The QT approximation near $X = 1$, upper sign	92

10. Some representative curves for the refractive index (μ) and the absorption index (χ)

10.1	Introduction	94
10.2	The magnitudes of μ and χ near the possible reflection levels	94
10.3	The method for sketching approximate curves	95
10.4	Some particular examples	96

11. The group velocity

11.1	No magnetic field	103
11.2	An imposed magnetic field	103

PART III. APPLICATIONS TO THE
TERRESTRIAL IONOSPHERE

12. A model ionosphere with no magnetic field	
12.1	Two model ionospheres page 108
12.2	The penetration frequency 109
12.3	The height of reflection 109
12.4	The equivalent height of reflection 111
12.5	The absorption of the wave 113
	(a) Non-deviative absorption 114
	(b) Deviative absorption 116
13. A model ionosphere with a magnetic field	
13.1	Form of the $h'(f)$ curves over a wide range of frequency 117
13.2	Magneto-ionic splitting 121
13.3	The effect of collisions on magneto-ionic splitting 123
13.4	Shapes of the $h'(f)$ curves for high frequencies 124
13.5	Triple splitting and the Z -trace 126
13.6	Non-deviative absorption, QL approximation 131
13.7	Deviative absorption 132
	(a) Ordinary wave, QT approximation 132
	(b) Extraordinary wave, QL approximation 132
13.8	Gyro-frequency splitting 133
13.9	The 'fourth reflection condition' 137
13.10	Low and very low frequencies and the lowest ionosphere 138
13.11	$\mu(h)$ and $\chi(h)$ curves for different frequencies in the model ionosphere of fig. 13.13 141
14. The nature of the electrons' motions in the ionosphere	
14.1	Magnitudes in the absence of a magnetic field 144
14.2	Heating of the electrons and ionospheric cross-modulation (imposed field neglected) 146
14.3	Magnitudes in the presence of a magnetic field 147
14.4	Energy relations in the presence of a magnetic field 150

PART IV. SOME MISCELLANEOUS CONSIDERATIONS

15. The Lorentz Term

15.1	Introduction	<i>page</i> 154
15.2	History	154
15.3	Consequences of including the Lorentz Term ($l = \frac{1}{3}$)	157
15.4	Experimental test of the Lorentz theory	159
	(a) Oblique reflection from a layer	159
	(b) Phenomena near the gyro-frequency	162
	(c) Very low frequencies	162
	(d) Results from rocket experiments	164

16. Waves in a mixture of ions and electrons

16.1	Introduction	165
16.2	The refractive index of a mixture	165
16.3	The results for some special cases	169
16.4	The effects of collisions in electron-ion mixtures	171

17. Inhomogeneous media

17.1	Introduction	172
17.2	Conditions for reflection at vertical incidence (no imposed field)	172
17.3	Coupling between characteristic waves	176
17.4	The coupling echo	178
17.5	Emergent polarisation	178
	(a) Passage through a region of strong coupling	179
	(b) Limiting polarisation	179

18. A magneto-ionic medium considered as an anisotropic dielectric, and a comparison with crystal optics

18.1	Introduction	181
18.2	Calculation of refractive index using tensor notation	182
18.3	The dielectric and susceptibility tensors	184
18.4	The principal directions	185

18.5	The wave-velocity surfaces and the $\mu(\theta)$ surfaces	<i>page</i> 186
18.6	The optic axes	188
18.7	The travel of wave packets and the ray-direction	190

APPENDIX		192
-----------------	--	-----

BIBLIOGRAPHY

PART I.	Annotated references arranged alphabetically under authors	193
PART II.	Abbreviated references appropriate to sections of the book	202
