

CONTENTS

CHAPTER	PAGE
I TURBULENCE IN GENERAL	I
Introduction. Viscosity. Turbulence on the laboratory scale. The nature and definition of turbulence. Mathematical approach to the theory of turbulent motion. The analogy between turbulence and molecular structure	
II THE METEOROLOGY OF THE LOWER ATMOSPHERE	14
Gustiness and the diurnal variation of turbulence. The diurnal variation of temperature gradient. The adiabatic lapse rate and its significance. The velocity profile near the ground. The eddy velocities near the ground. Shearing stress near the ground. The thermal structure of the lower atmosphere in clear summer weather. The gradient of humidity in the lower atmosphere	
III EARLY THEORIES AND THEIR APPLICATION TO LARGE-SCALE PHENOMENA	29
Wind in the friction layer. The diurnal temperature wave and its variation with height. The diffusion of matter. Empirical formulae for K as a function of height. The propagation of the diurnal temperature wave with K a power of the height. The constancy of the shearing stress with height and the conjugate power law theorem. General conclusions on the 'K-theory'	
IV MIXING LENGTH AND STATISTICAL THEORIES OF TURBULENCE	44
The concept of the mixing length. The mixing length in relation to the velocity profile. Statistical theories of turbulence	
V DIFFUSION IN THE ATMOSPHERE NEAR THE GROUND	67
Statement of the problem and the experimental data. The adaptation of the statistical theory of turbulence to diffusion over smooth surfaces. Solution of the steady state infinite line source problem and extension to three dimensions. Evaporation from a smooth saturated surface. Diffusion in aerodynamically rough flow. Diffusion in the similarity theory of turbulence.	

	PAGE
VI TURBULENCE IN A VARIABLE DENSITY GRADIENT	91
The Richardson Number and the criterion of turbulence. Convection in the lower atmosphere. The problem of the convective jet.	
APPENDIX. NUMERICAL DATA FOR FLOW NEAR THE SURFACE OF THE EARTH	107
INDEX	109
