Contents

PREFACE

CHAPTER I Introduction to matrix calculations • 1

I.1 Introductory discussion • 1
I.2 Matrix multiplication • 4
I.3 Null matrices • 9
I.4 Unit matrices • 10
I.5 Diagonal matrices • 10
I.6 Multiple products • 11
I.7 Matrix addition and subtraction • 12
I.8 Transpose matrices • 13
I.9 Determinants • 14
I.10 Division of matrices and matrix inversion • 16
I.11 Matrix diagonalization • 18
I.12 Eigenvalues and eigenvectors of a 2×2 unimodular matrix • 19

CHAPTER II Matrix methods in paraxial optics • 24

II.1 Introductory discussion • 24
II.2 Ray-transfer matrices • 26
II.3 The translation matrix $\mathscr{T}$ • 29
II.4 The refraction matrix $\mathscr{R}$ • 32
II.5 The ray-transfer matrix for a system • 35
II.6 Derivation of properties of a system from its matrix • 39
II.7 Illustrative problems • 43
II.8 Experimental determination of the matrix elements of an optical system • 52
II.9 Locating the cardinal points of a system • 54
II.10 Further problems • 60
II.11 Extension of ray-transfer method to reflecting systems • 67

CHAPTER III Optical resonators and laser beam propagation • 76

III.1 Review of results obtained for paraxial imaging systems • 76
III.2 Description of wave propagation in terms of geometrical optics • 79
III.3 Resolving power, étendue and the space-bandwidth product • 91
III.4 Matrix representation of an optical resonator • 97
III.5 The distinction between stable and unstable resonators • 108
III.6 Propagation of a Gaussian beam and its complex curvature parameter • 116
III.7 Predicting the output of a laser oscillator • 122
III.8 Application of the *ABCD* rule to mode-matching problems • 133
III.9 Ray-transfer matrices for distributed lens-like media • 151
III.10 Illustrative problems • 161

CHAPTER IV Matrices in polarization optics • 179

IV.1 Polarized light - its production and analysis • 179
IV.2 The Stokes parameters for specifying polarization • 189
IV.3 Use of the Mueller calculus for transforming a Stokes column • 194
IV.4 Experimental determination of the elements of a Mueller matrix or a Stokes column • 202
IV.5 Use of the Jones calculus for transforming a Maxwell column • 207
IV.6 Experimental determination of the elements of a Jones matrix or a Maxwell column • 211
IV.7 Illustrative problems solved by Mueller calculus and by Jones calculus • 221

CHAPTER V Propagation of light through crystals • 240

V.1 Introductory discussion • 240
V.2 Expression of vector operations in matrix form • 240
V.3 Dielectric properties of an anisotropic medium • 247
V.4 Propagation of plane waves in a uniaxial crystal • 251
V.5 Huygens wavelets in a uniaxial crystal • 259

APPENDIXES

A Aperture properties of centred lens systems • 263
B Matrix representation of centring and squaring errors • 286
C Statistical derivation of the Stokes parameters • 292
D Derivation of Mueller matrices • 302
E Derivation of Jones matrices • 322
F Connection between Jones and Mueller calculi • 328

BIBLIOGRAPHY AND CONCLUSION • 338

INDEX • 342
