Contents

Preface xi

1 Introduction and overview 1
1.1 Some history 1
1.2 Examples of chaotic behavior 2
1.3 Dynamical systems 6
1.4 Attractors 10
1.5 Sensitive dependence on initial conditions 15
1.6 Delay coordinates 19
Problems 21
Notes 22

2 One-dimensional maps 23
2.1 Piecewise linear one-dimensional maps 23
2.2 The logistic map 31
2.3 General discussion of smooth one-dimensional maps 44
2.4 Examples of applications of one-dimensional maps to chaotic systems of higher dimensionality 56
Appendix: Some elementary definitions and theorems concerning sets 64
Problems 66
Notes 68

3 Strange attractors and fractal dimension 69
3.1 The box-counting dimension 69
3.2 The generalized baker's map 75
3.3 Measure and the spectrum of D_q dimensions 78
3.4 Dimension spectrum for the generalized baker's map 81

3.5 Character of the natural measure for the generalized baker's map 83
3.6 The pointwise dimension 86
3.7 Implications and determination of fractal dimension in experiments 89
3.8 Embedding 93
3.9 Fat fractals 97
Appendix: Hausdorff dimension 100
Problems 103
Notes 106

4 Dynamical properties of chaotic systems 108
4.1 The horseshoe map and symbolic dynamics 108
4.2 Linear stability of steady states and periodic orbits 115
4.3 Stable and unstable manifolds 122
4.4 Lyapunov exponents 129
4.5 Entropies 138
4.6 Controlling chaos 145
Appendix: Gram–Schmidt orthogonalization 148
Problems 148
Notes 150

5 Nonattracting chaotic sets 151
5.1 Fractal basin boundaries 152
5.2 Final state sensitivity 158
5.3 Structure of fractal basin boundaries 161
5.4 Chaotic scattering 166
5.5 The dynamics of chaotic scattering 170
5.6 The dimensions of nonattracting chaotic sets and their stable and unstable manifolds 176
Appendix: Derivation of Eqs. (5.3) 179
Problems 181
Notes 183

6 Quasiperiodicity 184
6.1 Frequency spectrum and attractors 184
6.2 The circle map 190
6.3 N frequency quasiperiodicity with $N > 2$ 200
6.4 Strange nonchaotic attractors of quasiperiodically forced systems 205
Problems 206
Notes 206

7 Chaos in Hamiltonian systems 208
7.1 Hamiltonian systems 208
7.2 Perturbation of integrable systems 224
7.3 Chaos and KAM tori in systems describable by two-dimensional Hamiltonian maps 235
7.4 Higher-dimensional systems 255
7.5 Strongly chaotic systems 257
7.6 The succession of increasingly random systems 261
Problems 262
Notes 264

8 Chaotic transitions 266
8.1 The period doubling cascade route to chaotic attractors 267
8.2 The intermittency transition to a chaotic attractor 272
8.3 Crises 277
8.4 The Lorenz system: An example of the creation of a chaotic transient 291
8.5 Basin boundary metamorphoses 294
8.6 Bifurcations to chaotic scattering 299
Problems 303
Notes 304

9 Multifractals 305
9.1 The singularity spectrum $f(\alpha)$ 305
9.2 The partition function formalism 313
9.3 Lyapunov partition functions 316
9.4 Distribution of finite time Lyapunov exponents 322
9.5 Unstable periodic orbits and the natural measure 326
9.6 Validity of the Lyapunov and periodic orbits partition functions for nonhyperbolic attractors 330
Problems 332
Notes 332

10 Quantum chaos 334
10.1 The energy level spectra of chaotic, bounded, time-independent systems 336
10.2 Wavefunctions for classically chaotic, bounded, time-independent systems 352
10.3 Temporally periodic systems 354
10.4 Quantum chaotic scattering 360
Problems 361
Notes 361
