Foreword vii
Preface ix
Introduction 1

PART 1. MATHEMATICAL METHODS

1 From Delta Functions to Distributions 5
BY ARTHUR ERDELYI

1.1 Introduction 5

Delta Functions and Other Generalized Functions

1.2 The Delta Function 6
1.3 Other Generalized Functions 8

Mikusiński's Theory of Operational Calculus and Generalized Functions

1.4 The Definition of Operators 9
1.5 Differential and Integral Operators 13
1.6 Limits of Convolution Quotients 15
1.7 Operator Functions 18
1.8 Exponential Functions 21
1.9 The Diffusion Equation 23
1.10 Extensions and Other Theories 24

Distributions

1.11 Testing Functions 24
1.12 The Definition of Distributions 26
1.13 Operations with Distributions 29
1.14 Convergence of Distributions 34
1.15 Further Properties of Distributions 39

Applications and Extensions

1.16 Application to Fourier Transforms 42
1.17 Application to Differential Equations 45
1.18 Extensions and Alternative Theories 48

2 Operational Methods for Separable Differential Equations BY BERNARD FRIEDMAN

2.1 Introduction *51*
2.2 Heaviside Theory *53*
2.3 Domain of an Operator *56*
2.4 Linear Operators *57*
2.5 Functions of Operators *58*
2.6 Eigenfunctions and Self-adjoint Operators *59*
2.7 Spectral Representation *61*
2.8 A Partial Differential Equation *63*
2.9 Types of Spectral Representation *64*
2.10 Conclusion *66*

3 Integral Transforms BY JOHN W. MILES **68**

3.1 Introduction *68*

Inversion Formulas and Transform Pairs

3.2 Fourier's Integral Formulas *71*
3.3 Fourier Transform *73*
3.4 Fourier Cosine and Sine Transforms *73*
3.5 Laplace Transform *74*
3.6 Mellin Transform *75*
3.7 Multiple Fourier Transforms *75*
3.8 Hankel Transforms *75*

The Laplace Transform

3.9 Introduction *78*
3.10 Transforms of Derivatives *78*
3.11 Heaviside's Shifting Theorem *78*
3.12 Convolution Theorem *79*
3.13 Inversion Procedures *80*
3.14 A Problem in Wave Motion *82*
3.15 A Problem in Heat Conduction *85*
3.16 A Problem in Supersonic Flow *87*

Fourier Transforms

3.17 Introduction *88*
3.18 Transforms of Derivatives *88*
3.19 Application to a Semi-infinite Domain *89*
3.20 Initial-value Problem for One-dimensional Wave Equation *89*

Hankel Transforms

3.21 Introduction *90*
3.22 Problem of an Oscillating Piston *90*

Finite Fourier Transforms

3.23 Introduction *92*
3.24 Finite Cosine and Sine Transforms *93*
3.25 A Problem in Wave Motion *94*
3.26 Conclusion *95*

4 Semigroup Methods in the Theory of Partial Differential Equations BY RALPH S. PHILLIPS **100**

4.1 Introduction *100*
4.2 Semigroups of Operators on Finite-dimensional Spaces *103*
4.3 Hilbert Space *104*
4.4 Semigroups of Operators on a Hilbert Space *110*
4.5 Hyperbolic Systems of Partial Differential Equations *114*
4.6 Maximal Dissipative Operators *119*
4.7 Parabolic Partial Differential Equations *128*

5 Asymptotic Formulas and Series BY J. BARKLEY ROSSER **133**

5.1 Introduction *133*
5.2 Definitions *134*
5.3 Integration by Parts *138*
5.4 The Generalized Watson's Lemma *140*
5.5 Asymptotic Solution of Differential Equations *141*
5.6 Other Methods of Deriving Asymptotic Series *144*
5.7 Eulerizing *144*
5.8 Continued Fractions *146*
5.9 Laplace's Method *147*
5.10 The Method of Stationary Phase *151*
5.11 The Method of Steepest Descent *152*
5.12 Further Use of Integration by Parts *159*

PART 2. STATISTICAL AND SCHEDULING STUDIES

6 Chance Processes and Fluctuations BY WILLIAM FELLER **167**

6.1 Introduction *167*

Sums of Random Variables

6.2 Cumulative Effects *168*
6.3 The Simplest Random-walk Model *168*
6.4 The Fokker-Planck Equation *170*
6.5 Example *171*
6.6 Generalizations *172*
6.7 The "Ruin" Problem *173*

Queueing Problems

6.8 Holding and Waiting Times; Discipline *174*
6.9 Random-walk Model; the Differential Equations *176*
6.10 Steady State *177*
6.11 Busy Periods *178*
6.12 Fluctuations in the Individual Process vs. Ensemble Averages *180*
6.13 The Example of D. G. Kendall's Taxicab Stand *181*

7 Information Theory BY DAVID BLACKWELL **182**

7.1 Introduction *182*
7.2 An Example *182*
7.3 Entropy *183*
7.4 Capacity of a Channel *185*
7.5 The Fundamental Theorem *186*
7.6 Multistate Channels *190*
7.7 Entropy of a Process; Capacity of Finite-state Channels *191*

8 The Mathematical Theory of Control Processes **194**
BY RICHARD BELLMAN

8.1 Introduction *194*

Determinate Control Processes

8.2 The Calculus of Variations *196*
8.3 A Catalogue of Catastrophes *197*
8.4 Quadratic Criteria and Linear Equations *198*
8.5 Linear Criteria and Linear Constraints *199*
8.6 Nonlinear Criteria and Constraints *199*
8.7 Implicit Functionals *200*
8.8 Dynamic Programming *201*
8.9 Trajectories *202*
8.10 Computational Aspects *202*

Stochastic Control Processes and Game Theory

8.11 Stochastic Effects *202*
8.12 Games against Nature *203*
8.13 Pursuit Processes *204*
8.14 Analytic Techniques *204*

Adaptive Control Processes

8.15 Adaptive Systems *204*
8.16 Functional-equation Approach *205*

8.17 Computational Aspects *206*

An Illustrative Example

8.18 Formulation *206*
8.19 Deterministic Case *207*
8.20 Stochastic Case *207*
8.21 Adaptive Case *208*

9 Formulating and Solving Linear Programs **213**

BY GEORGE B. DANTZIG

9.1 Introduction *213*
9.2 Formulating a Linear-programming Model *213*
9.3 Building the Model *215*
9.4 The Linear-programming Model Illustrated *216*
9.5 Algebraic Statement of the Linear-programming Problem *220*
9.6 Outline of the Simplex Method *222*
9.7 Test for Optimal Feasible Solution *223*
9.8 Improving a Nonoptimal Basic Feasible Solution *224*
9.9 General Iterative Procedure *225*
9.10 Finding an Initial Basic Feasible Solution *226*

10 The Mathematical Theory of Inventory Processes **228**

BY SAMUEL KARLIN

10.1 Introduction *228*
10.2 Factors of the Inventory Process *229*
10.3 Cost Factors *229*
10.4 The Nature of Demand *230*
10.5 The Nature of Supply *230*
10.6 The Structure of the Inventory Process *231*
10.7 Classification of Inventory Models *232*
10.8 Historical Inventory Models *233*
10.9 The Literature of Inventory Theory *236*
10.10 Deterministic Inventory Models *237*
10.11 One-stage Stochastic Inventory Models *242*
10.12 Optimal Policy for Dynamic Stochastic Inventory Problems *244*
10.13 Model of Hydroelectric Generation with Stochastic Inflow *246*
10.14 Steady-state Solution of Inventory Problems *248*
10.15 Stationary Inventory Model *249*
10.16 Inventory Model with a Random Supply *252*
10.17 Stationary Distribution for a Model of Lagged Delivery *255*

PART 3. PHYSICAL PHENOMENA

11 Monte Carlo Calculations in Problems of Mathematical Physics BY STANISLAW M. ULAM 261

11.1 Introduction *261*
11.2 A Combinatorial Problem *263*
11.3 Branching Processes *264*
11.4 Multidimensional Branching Processes *270*
11.5 Statistical Sampling Methods *275*
11.6 Reactions in a Heavy Nucleus *276*
11.7 The Petit Canonical Ensemble *276*
11.8 Iterates of Transformations, Ergodic Properties, and Time Averages *277*

12 Difference Equations and Functional Equations in Transmission-line Theory BY RAYMOND REDHEFFER 282

12.1 Introduction *282*

The Algebraic Foundations

12.2 An Instructive Special Case *284*
12.3 The Composition of Networks in General *285*
12.4 Matrix Multiplication *288*
12.5 Lossless Networks and the Reciprocity Theorem *290*
12.6 Passive Networks *292*
12.7 The Associated Linear Fractional Transformation *293*
12.8 Another Characterization of Passive Networks *295*
12.9 Fixed Points and Commutativity *297*
12.10 Series of Obstacles; the Cascade Problem *298*
12.11 Identical Networks in Cascade *300*

Functional Equations

12.12 Homogeneous Anisotropic Media *301*
12.13 Solution of the Equations *302*
12.14 Application to the Cascade Problem *303*
12.15 Interpretation of the Constants *304*
12.16 Nonuniform Dielectric Media *306*
12.17 Linearization *309*
12.18 Conditions for a Passive Solution *310*
12.19 Probability: a Reinterpretation *312*
12.20 The Scattering Matrix *313*
12.21 The Underlying Closure Principle *315*

Transmission and Reflection Operations

12.22 Transmission, Reflection, and Scattering Matrices *318*
12.23 The Star Product and Closure *319*

12.24 The Norm and Energy Transfer *322*
12.25 The Matching Problem *323*
12.26 Further Discussion of Passive Networks *325*
12.27 Inequalities for the Differential System *327*
12.28 The Probability Scattering Matrix *328*
12.29 A More General Interpretation *330*
12.30 A Special Case and Examples *331*

13 Characteristic-value Problems in Hydrodynamic and Hydromagnetic Theory **338**
BY SUBRAHMANYAN CHANDRASEKHAR

13.1 Introduction *338*
13.2 The Rayleigh Criterion for the Stability of Inviscid Rotational Flow *339*
13.3 Analytical Discussion of the Rayleigh Criterion *340*
13.4 The Stability of Viscous Rotational Flow *343*
13.5 On Methods of Solving Characteristic-value Problems in High-order Differential Equations *346*

14 Applications of the Theory of Partial Differential Equations to Problems of Fluid Mechanics **347**
BY PAUL R. GARABEDIAN

14.1 Introduction *347*
14.2 Cauchy's Problem for a Hyperbolic Partial Differential Equation in Two Independent Variables *349*
14.3 The Method of Finite Differences *356*
14.4 Cauchy's Problem in the Elliptic Case *360*
14.5 Flow around a Bubble Rising under the Influence of Gravity *365*
14.6 The Detached-shock Problem *368*

15 The Numerical Solution of Elliptic and Parabolic Partial Differential Equations BY DAVID YOUNG **373**

15.1 Introduction *373*
15.2 Boundary-value Problems and the Method of Finite Differenccs *378*
15.3 Point Iterative Methods *384*
15.4 Peaceman-Rachford Iterative Method *390*

15.5 Other Iterative Methods for Solving Elliptic Equations *394*
15.6 Parabolic Equations—Forward-difference Method *397*
15.7 The Crank-Nicolson Method *402*
15.8 The Alternating-direction Method for Parabolic Equations Involving Two Space Variables *405*
15.9 Illustrative Examples *407*
15.10 The SPADE Project for the Development of a Computer Program for Solving Elliptic and Parabolic Equations *413*

16 Circle, Sphere, Symmetrization, and Some Classical Physical Problems BY GEORGE PÓLYA **420**

16.1 Introduction *420*

The Heuristic Aspect

16.2 Observations *420*
16.3 Conjectures *422*
16.4 A Line of Inquiry *423*
16.5 Plane *424*
16.6 Space *426*
16.7 Applications *427*

The Key Idea of the Proof

16.8 Definition *429*
16.9 From Surface Area to Dirichlet Integral *430*
16.10 A Minor Remark *432*
16.11 Symmetrization and Principal Frequency *432*
16.12 Scope of the Proof *433*

Additional Remarks

16.13 Alternative Symmetrization *435*
16.14 Uniqueness *436*
16.15 Where the Alternative Symmetrization Leaves No Alternative *439*
16.16 One More Inequality Suggested by Observation *440*
