

CONTENTS

1	INTRODUCTION	1
1.1	General characteristics	2
1.2	Applications	8
1.3	Development of the theory of charge exchange	10
1.4	A simple model	11
2	ELASTIC SCATTERING OF IONS BY ATOMS	16
2.1	Introduction	16
2.2	The interaction potential between atomic systems	17
2.3	The classical approximation	19
2.3.1	The classical trajectory and the deflection function	21
2.3.2	The cross section	23
2.4	The semi-classical approximation	25
2.5	Scattering outside the small-angle region	29
2.6	Rainbow scattering	33
2.7	Orbiting	34
2.8	Small-angle scattering	35
2.9	Identical particles	37
2.10	The inverse problem	38
3	INELASTIC ION-ATOM COLLISIONS – COUPLED CHANNEL MODELS	39
3.1	The Schrödinger equation	39
3.2	Asymptotic wave functions and boundary conditions	43
3.3	The variational method and the derivation of coupled channel equations	46
3.4	Coupled equations using the molecular coordinate system (\mathbf{s}, \mathbf{R})	53
3.5	Partial-wave expansions	61
3.6	Semi-classical approximations to the coupled channel equations	64
3.6.1	The WKB approximation to the radial equations	64
3.6.2	The eikonal approximation to the coupled channel equations	70

3.7	The impact parameter model	73
3.7.1	The connection between the impact parameter and eikonal models	82
3.8	Differential cross sections in the impact parameter model	83
4	CHARGE EXCHANGE AT VERY LOW ENERGIES – THE PERTURBED STATIONARY STATE MODEL	90
4.1	The perturbed stationary state model	90
4.2	Adiabatic molecular orbitals – rotating coordinates	94
4.3	Partial-wave expansions and the radial equations	102
4.4	Radial and rotational couplings – diabatic representations	105
4.5	Applications of the perturbed stationary state model	110
4.6	The modified perturbed stationary state model	122
4.7	Systems with several electrons	127
4.8	Radiative charge transfer	128
5	THE IMPACT PARAMETER MODEL	132
5.1	The molecular orbital basis	133
5.2	Rotating coordinates in the impact parameter model	134
5.3	Choice of translation factors	137
5.3.1	Plane-wave translation factors	137
5.3.2	Common translation factors	140
5.3.3	Optimization	142
5.3.4	State-dependent phase factors	147
5.4	Atomic orbital basis sets	152
5.4.1	Symmetries of the matrix elements	153
5.4.2	Two-state approximation for charge exchange	155
5.5	The role of the continuum	158
5.5.1	Eigendifferentials	159
5.5.2	Pseudostates	162
5.6	The wave function at small internuclear separations – the united atom limit	169
5.7	The mixed AO/MO expansion	172
5.8	Sturmian, Gaussian, and polynomial expansions	173
5.9	Systems with several electrons	177
5.10	Direct solutions of the time-dependent Schrödinger equation	179
6	APPLICATIONS OF THE COUPLED CHANNEL IMPACT PARAMETER MODEL	183
6.1	Introduction	183

6.2	Homonuclear one-electron systems	186
6.2.1	$H^+ + H(1s)$	186
6.2.2	Systems with $Z_A = Z_B > 1$	201
6.3	Heteronuclear one-electron systems	202
6.4	Quasi-one-electron systems	213
6.5	Two-electron systems	215
6.5.1	Homonuclear systems; H_2, He_2^+	215
6.5.2	Heteronuclear systems; $H^+ + He$	220
6.5.3	Quasi-two-electron systems	226
6.6	Conclusions	227
7	APPROXIMATE SOLUTIONS OF COUPLED CHANNEL EQUATIONS	228
7.1	The Landau–Zener–Stueckelberg approximation	228
7.2	Non-linear models	240
7.2.1	The Rosen–Zener approximation	240
7.2.2	Nikitin–Demkov models	242
7.2.3	Further non-linear models	245
7.3	The multichannel Landau–Zener approximation	246
7.4	Perturbation series and the Bates distorted wave model	248
7.5	The unitarized distorted wave approximation	260
7.6	The Magnus approximation	263
8	INTERMEDIATE ENERGIES	267
8.1	Single-centre expansions	267
8.2	Corrections to the single-centre expansion	274
8.3	The optical potential	278
8.4	The classical trajectory Monte Carlo model	290
9	MANY-ELECTRON SYSTEMS	300
9.1	Introduction	300
9.2	The Harel–Salin OEDM model	301
9.3	The time-dependent Hartree–Fock model	305
9.4	Cross sections within the independent particle model	315
9.5	Two-electron transitions	325
10	NON-RELATIVISTIC MODELS AT HIGH ENERGIES	331
10.1	Introduction	331
10.2	Perturbation theory and the impact parameter model	334
10.3	Distorted wave series	348
10.4	Applications of the boundary corrected and distorted wave Born approximations	351

10.5	The strong potential Born and impulse approximations	358
10.6	The continuum distorted wave and eikonal models	363
10.7	Quantum perturbation expansions for charge exchange and knock-on collisions	370
10.8	Ionization and charge exchange into the continuum	378
11	CHARGE EXCHANGE AT RELATIVISTIC ENERGIES	383
11.1	The relativistic impact parameter model	386
11.2	Coupled channel models	393
11.3	Relativistic perturbation and distorted wave approximations	399
11.4	Radiative charge transfer	405
11.5	Electron-positron pair creation and electron capture	406
Appendix A.	A note on units and constants	410
Appendix B.	Centre-of-mass and laboratory coordinates	412
Appendix C.	The WKB approximation to the phase shifts	415
Appendix D.	Adiabatic diatomic molecular orbitals for one-electron systems	420
Appendix E.	Exchange matrix elements with a Slater basis	427
Appendix F.	Matrix elements with a Gaussian basis	436
Appendix G.	Green's functions in the impact parameter model	442
	Selected bibliography of books and review articles	446
	References	448
	Index	469
