PREFACE

x i

Chapter 1. Kinetic Equations

1.1. Transport Equation	2
1.2. Feedback	11
1.3. Kinetic Equations	23
1.4. Reduced Forms of the Kinetic Equations	27
1.5. Simple Kinetic Models	33
Problems	42
References	47

Chapter 2. Point Kinetic Equations

2.1. Mathematical Preliminaries	49
2.2. Stationary Reactor and the Multiplication Factor	53
2.3. Adjoint Angular Density and Neutron Importance	57
2.4. Reduction of the Kinetic Equations	62
2.5. Alternative Derivations of the Point Kinetic Equations	72
2.6. Point Reactor Kinetic Equations with Feedback	74

2.7. Calculation of Kinetic Parameters in the Diffusion Approximation Problems References	79 84 87
---	----------------

Chapter 3. Exact Solutions of the Point Kinetic Equations without Feedback

3.1. Standard and Integrodifferential Forms of the Point Kinetic Equations	89
3.2. Inverse Method for Solving Kinetic Problems	91
3.3. Exact Solution of Reactor Kinetic Equations for a Known Reactivity Insertion Problems References	97 113 114

Chapter 4. Approximate Solutions of the Point Kinetic Equations without Feedback

4.1. Approximation of Constant Delayed-Neutron Production Rate	116
4.2. The Prompt-Jump Approximation	119
4.3. Gradual Reactivity Changes	121
4.4. Small-Amplitude Approximation (Linearization)	135
4.5. Logarithmic Linearization	153
4.6. Perturbation Analysis	156
4.7. The Response of a Reactor to Large Periodic Reactivity Variations Problems References	169 178 182

Chapter 5. Mathematical Description of Feedback

5.1. Feedback Kernels	185
5.2. Temperature Feedback	191
5.3. Xenon Feedback	209
5.4. Transfer Function of a Reactor with Feedback	216
5.5. Response of a Reactor with Feedback to a Large Periodic Reactivity Insertion	224
5.6. Equivalent Space-Independent Temperature Models References	243 248

Chapter 6. Linear Stability Analysis

6.1. Characteristic Function and Linear Stability	251
6.2. Routh–Hurwitz Stability Criterion	255

6.3. Linear Stability Analysis of Xenon and Temperature Feedback	261
6.4. Pontryagin's Stability Criteria for Transcendental Equations	269
6.5. Nyquist Stability Criterion	276
6.6. Critical Power Level and the Effect of Delayed Neutrons on Linear Stability	285
6.7. Stability Margins	290
6.8. Stability of Distributed-Parameter Systems	291
6.9. The Theory of Linearization	304
Problems	314
References	316

Chapter 7. Nonlinear Stability Analysis

7.1. Concepts of Stability	319
7.2. General Criteria for Boundedness and Global Asymptotic Stability	325
7.3. Global Asymptotic Stability of Reactors with Linear Feedback	333
7.4. Asymptotic Stability of Reactors with a Nonlinear Feedback	341
7.5. Asymptotic Stability of an Integral Equation	346
7.6. Lyapunov's "Second Method"	354
7.7. The Lurie–Letov Function	368
7.8. The Lefschetz Criterion	384
7.9. Asymptotic Stability in a Finite Region	391
7.10. Popov Function	395
7.11. Criteria for Asymptotic Stability in the Frequency Domain	399
7.12. The Effects of Delayed Neutrons	416
7.13. Finite Escape Time and Boundedness	436
Problems	450
References	452

INDEX	454
