contents

	Preface	**vii**
1	**Introduction**	**1**
2	**Characterization of Radiation Fields and Sources**	**7**
2.1	Fundamental radiation field variables *7*	
2.2	Directional properties of the radiation field *14*	
2.3	Dosimetric quantities of a purely physical nature *18*	
2.4	Radiation quantities closely related to biological risk *22*	
2.5	General source properties *25*	
2.6	Conversion from distributed to discrete concepts, and vice versa *27*	

3 Interaction of Radiation with Matter 32

3.1 Interaction coefficient *32*
3.2 Microscopic cross section *34*
3.3 Cross sections for photon interactions *36*
3.4 Photon attenuation coefficients *44*
3.5 Photon absorption coefficients and related quantities *44*
3.6 Cross sections for neutron interactions *48*
3.7 Neutron scattering interactions *53*
3.8 Radiative capture *64*
3.9 Penetration of charged particles through matter *65*

4 Common Radiation Sources Encountered in Shield Design 78

4.1 Neutron sources *79*
4.2 Sources of gamma photons *90*
4.3 Sources of x rays *105*

5 Detector Response Functions 121

5.1 General formulation for dosimetric detectors *122*
5.2 Relationship of kerma rate and absorbed dose rate: charged-particle equilibrium *123*
5.3 Neutron kerma, absorbed dose, and dose equivalent rates *126*
5.4 Dosimetric response functions for photons *128*
5.5 Response functions for evaluation of hazards to human beings *134*
5.6 Concluding remarks *140*

6 Basic Concepts in Neutral Particle Penetration 145

6.1 Uncollided-particle attenuation and mean free path *145*
6.2 Total detector response *149*
6.3 Approximation formulas for total response *153*
6.4 Ray analysis technique *155*
6.5 Point kernel *175*

6.6 Geometric transformations *177*
6.7 Special concepts useful for design purposes *184*

7 Special Techniques in Photon Attenuation 189

7.1 Photon buildup-factor concept *189*
7.2 Buildup-factor values and empirical approximations *192*
7.3 Complex aspects of the buildup factor *196*
7.4 Extension of point-kernel techniques to incorporate buildup *199*
7.5 Special techniques for medical facilities *201*

8 Special Techniques in Neutron Attenuation 218

8.1 Differences between fast-neutron and photon flux density calculations *220*
8.2 Attenuation of fast neutrons from fission sources in hydrogenous media *221*
8.3 Removal cross sections *228*
8.4 Fast-neutron attenuation in nonhydrogenous media *238*
8.5 Calculation of the intermediate and thermal flux densities *240*
8.6 Capture-gamma-photon attenuation *250*
8.7 Neutron shielding by concrete slabs *254*

9 Approximate Techniques Under Special Geometric Conditions 266

9.1 Albedo concept *266*
9.2 Radiation streaming through ducts *285*
9.3 Treatment of shield heterogeneities *301*

10 The Transport Description of Radiation Penetration 310

10.1 Transport equation *310*
10.2 Approximations to the transport equation *329*
10.3 Method of moments *337*
10.4 Discrete-ordinates method *343*
10.5 Monte Carlo method *348*

11 Material and Structural Considerations in Shield Design 366

11.1 Material properties *367*
11.2 Radiation damage *379*
11.3 Thermal effects *387*
11.4 Thermal–mechanical interactions *393*

Appendices

1 Constants and conversion factors *408*
2 Mathematical functions of importance in shielding analysis *411*
3 Cross sections and related data for photon and neutron interactions *423*
4 Buildup factors for gamma photons *444*
5 Decay characteristics of selected radionuclides *459*
6 Parameters for use in calculating fission-product photon source strengths *468*
