Preface	v
1 Introduction and Basic Concepts	1
1.1 Examples of Inverse Problems	1
1.2 Ill-Posed Problems	9
1.3 The Worst-Case Error	14
1.4 Problems	21
2 Regularization Theory for Equations of the First Kind	23
2.1 A General Regularization Theory	24
2.2 Tikhonov Regularization	37
2.3 Landweber Iteration	42
2.4 A Numerical Example	45
2.5 The Discrepancy Principle of Morozov	48
2.6 Landweber's Iteration Method with Stopping Rule	53
2.7 The Conjugate Gradient Method	57
2.8 Problems	63
3 Regularization by Discretization	65
3.1 Projection Methods	66
3.2 Galerkin Methods	73
3.2.1 The Least Squares Method	76
3.2.2 The Dual Least Squares Method	78
3.2.3 The Bubnov–Galerkin Method for Coercive Operators	80
3.3 Application to Symm's Integral Equation of the First Kind	85
3.4 Collocation Methods	94

3.4.1	Minimum Norm Collocation	95
3.4.2	Collocation of Symm's Equation	99
3.5	Numerical Experiments for Symm's Equation	107
3.6	The Backus–Gilbert Method	115
3.7	Problems	122
4	Inverse Eigenvalue Problems	125
4.1	Introduction	125
4.2	Construction of a Fundamental System	127
4.3	Asymptotics of the Eigenvalues and Eigenfunctions	135
4.4	Some Hyperbolic Problems	146
4.5	The Inverse Problem	154
4.6	A Parameter Identification Problem	160
4.7	Numerical Reconstruction Techniques	165
4.8	Problems	170
5	An Inverse Scattering Problem	173
5.1	Introduction	173
5.2	The Direct Scattering Problem	177
5.3	Properties of the Far Field Patterns	187
5.4	Uniqueness of the Inverse Problem	196
5.5	Numerical Methods	204
5.5.1	A Simplified Newton Method	205
5.5.2	A Modified Gradient Method	209
5.5.3	The Dual Space Method	210
5.6	Problems	214
A	Basic Facts from Functional Analysis	215
A.1	Normed Spaces and Hilbert Spaces	215
A.2	Orthonormal Systems	222
A.3	Linear Bounded and Compact Operators	224
A.4	Sobolev Spaces of Periodic Functions	232
A.5	Spectral Theory for Compact Operators in Hilbert Spaces	239
A.6	The Fréchet Derivative	243
B	Proofs of the Results of Section 2.7	249
	References	261
	Index	279
