# THEORY OF POLYELECTROLYTE SOLUTIONS

JEAN-LOUIS BARRAT

*Département de Physique des Matériaux (URA CNRS 172)  
Université Claude Bernard Lyon I Villeurbanne, France*

JEAN-FRANÇOIS JOANNY

*Institut Charles Sadron (UPR CNRS 022) Strasbourg, France*

## CONTENTS

- I. Introduction
- II. Charged Chains at Infinite Dilution: Asymptotic Properties
  - A. Definition of Model and Flory-like Calculation
  - B. Variational Approaches
  - C. Renormalization Group Calculations
  - D. Screening of Electrostatic Interactions
  - E. Annealed and Quenched Polyelectrolytes
- III. Local Aspects of Screening
  - A. Counterion Condensation
  - B. Poisson-Boltzmann Approach
  - C. Attractive Electrostatic Interactions
- IV. Electrostatic Rigidity
  - A. Odijk-Skolnick-Fixman Theory
  - B. Alternative Calculations for Flexible Chains
  - C. Case of Poor Solvents
- IV. Charged Gels and Brushes
  - A. Grafted Polyelectrolyte Layers
  - B. Polyelectrolyte Gels
- VI. Semidilute Solutions
  - A. Ordering Transitions in Polyelectrolyte Solutions
  - B. Correlation Length and Osmotic Pressure of Semidilute Polyelectrolyte Solutions
  - C. Electrostatic Rigidity in Semidilute Solutions
  - D. Concentrated Solutions of Flexible Polyelectrolytes
  - E. Mesophase Formation in Poor Solvents

**VII. Dynamic Properties****A. Mobility and Electrophoretic Mobility of a Single Charged Chain****B. Viscosity of Polyelectrolyte Solutions****VIII. Conclusions****Appendix A: Effective Interaction between Charged Monomers****Appendix B: Relaxation and Electrophoretic Effects****B.1. Relaxation Field****B.2. Electrophoretic Field**

# STAR POLYMERS: EXPERIMENT, THEORY, AND SIMULATION

GARY S. GREEST, LEWIS J. FETTERS, AND JOHN S. HUANG

*Corporate Research Science Laboratories, Exxon Research and  
Engineering Company. Annandale, New Jersey*

DIETER RICHTER

*Institut für Festkörperforschung, Jülich, Germany*

## CONTENTS

- I. Introduction
- II. Synthesis
  - A. Chlorosilanes
  - B. Divinylbenzene
- III. Length Scales of a Star
- IV. Scaling Theory
- V. Computer Simulations
  - A. Good Solvent
  - B.  $\Theta$  and Poor Solvent
  - C. Relaxation of Star Polymers
- VI. Scattering Methods
  - A. Small-Angle Neutron Scattering
  - B. Qualitative Features of the Form Factor
  - C. Theoretical Models for Form Factor
  - D. Comparison to Simulations
- VII. Concentration Dependence
  - A. Theory
  - B. Experiment
- VIII. Internal Dynamics of Star Polymers
  - A. Neutron Spin Echo Method
  - B. Quasi-elastic Scattering for Polymer Solutions: Zimm Model
  - C. Collective and Single-Star Relaxation
  - D. Partial Dynamic Structure Factors and RPA Approach

IX. Diffusion and Viscosity of Star Polymers

X. Applications

Appendix A: Derivation of  $\langle R_G^2 \rangle$  and  $P(Q)$  for Gaussian Star

Appendix B

References

# TETHERED POLYMER LAYERS

I. SZLEIFER AND M. A. CARIGNANO

*Department of Chemistry  
Purdue University  
West Lafayette, Indiana*

## CONTENTS

- I. Introduction
- II. Theoretical Approaches
  - A. Volume-Filling Constraints or Incompressibility Assumption
  - B. Single-Chain Mean-Field Theory
    - 1. Minimization of Free Energy
    - 2. Expansion of Partition Function
    - 3. Thermodynamic Quantities
  - C. Self-Consistent Field Theory
  - D. Analytical Approaches
- III. Tethered Polymers in Good-Solvent Regime
  - A. Conformational Behavior of Linear Chains
  - B. Thermodynamic Properties
  - C. Adsorption from Solution
  - D. Changing Chain Architecture
- IV. Varying Solvent Quality
  - A. Conformational Properties
  - B. Phase Behavior
- V. Tethered Polymers on Curved Surfaces
  - A. Conformational Properties
  - B. Thermodynamic Behavior
- VI. Elastic Properties of Diblock Copolymer Films at Liquid–Liquid Interfaces
- VII. SummaryAppendix
- Appendix
- References

# LIVING POLYMERS

SANDRA C. GREER

*Department of Chemical Engineering, University of Maryland at College  
Park, College Park, Maryland*

## CONTENTS

- I. Introduction
  - A. General Reaction Mechanism
  - B. History
  - C. Issues
- II. Reaction Parameters
  - A. Thermodynamic Parameters
  - B. Solvent Effects
  - C. Initiator Effects
- III. Specific Example:  $\alpha$ -Methylstyrene
  - A. Mechanisms
  - B. Polymerization Line and Thermodynamic Parameters
- IV. Thermodynamics
  - A. Statistical Mechanical Models
    - 1. Mean Field
    - 2. Non-Mean Field
  - B. Experimental Measurements
    - 1. Extent of Polymerization
    - 2. Mass Density
    - 3. Concentration Susceptibility
    - 4. Phase Diagram in Poor Solvent
- V. Structure: Correlation Length
- VI. Conclusions
  - A. Where Are We Now?
    - 1. Macroscopic Properties
    - 2. Microscopic Properties
  - B. What Are Some Interesting Questions?
    - 1. Macroscopic Properties
    - 2. Microscopic Properties

Acknowledgments

# TRANSPORT AND KINETICS IN ELECTROACTIVE POLYMERS

MICHAEL E. G. LYONS

*Electroactive Polymer Research Group Physical Chemistry Laboratory  
University of Dublin, Trinity College Dublin, Ireland*

## CONTENTS

- I. Introduction
  - A. Electroactive Polymer Materials
  - B. Outline of Present Review
- II. Charge Percolation in Electroactive Polymers: Basis Concepts
  - A. Redox Polymers and Loaded Ionomers
    - 1. Introduction
    - 2. Electron Hopping: Quasi-diffusional Model
    - 3. Intersite Electron Hopping: Percolation Models and Long-Range Electron Transfer Considerations
    - 4. Local Field Corrections: Diffusion–Migration Effects in Electron Hopping
  - B. Electronically Conducting Polymers
    - 1. Introduction
    - 2. Doping Processes in Electronically Conducting Polymers
    - 3. Charge Carriers and Conductivity in Electronically Conducting Polymers
    - 4. Polymer Molar Mass and Chain Orientation Effects on Conductivity Behavior of Electronically Conducting Polymers: Pearson Model
    - 5. Redox Switching in Conjugated Polymer Thin Films
- III. Conduction in Electroactive Polymers: Complicating Factors
  - A. Nonideality in Electroactive Polymer Films
    - 1. Introduction
    - 2. Brown–Anson Model
    - 3. Albery–Colby Model
    - 4. Chidsey–Murray Model for Redox Conduction
  - B. Solvent, Salt, and Ion Transport in Electroactive Polymer Films
    - 1. Introduction
    - 2. EQCM and PBDS Methods: Principles and Case studies
    - 3. Effect of Observational Time Scale and Film History on Switching Kinetics

- IV. Electropolymerization Mechanisms: Nucleation and Growth of Electronically Conducting Polymer Films
  - A. Introduction
  - B. General Features of Electropolymerization Mechanism of Electronically Conductive Heterocyclic Polymers
  - C. Fundamentals of Nucleation and Layer Growth
    - 1. Introduction
    - 2. General Comments on Fundamental Thermodynamics and Kinetics of Nucleation
    - 3. Quantitative Analysis of Nucleation/Growth Processes
    - 4. Application to Electronically Conducting Polymers
- V. Complex Impedance Spectroscopy: Useful Technique for Quantifying Electronic and Ionic Conductivity in Electroactive Polymer Films
  - A. Introduction
  - B. Complex Impedance Response of Redox Polymer Films
  - C. Complex Impedance Response of Electronically Conducting Polymer Films
    - 1. Introduction
    - 2. Fletcher Dual-Rail Transmission Line Approach
- VI. Mediated Electrocatalysis Using Polymer-Modified Electrodes
  - A. Introduction and Overview
  - B. Heterogeneous Mediated Electrocatalysis: General Considerations
  - C. Theoretical Analysis of Mediated Electrocatalysis at Polymer Modified Electrodes.
    - 1. Introduction
    - 2. Alberly-Hillman Model for Mediated Electrocatalysis
    - 3. Alberly-Hillman Kinetic Case Diagram
    - 4. Experimental Determination of Diagnostic Parameters
    - 5. Optimizing Electrocatalysis
    - 6. Comparison with Experiment
- VII. Catalytic Systems Utilizing Electroactive Polymer Films that Exhibit Complex Michaelis-Menten Kinetic Behavior
  - A. Introduction
  - B. Lyons-Bartlett Model
  - C. Thin-Film Limit: Neglect of Concentration Polarization of Substrate in Layer
  - D. Low-Substrate-Concentration Limit
  - E. High-Substrate-Concentration Limit
  - F. General Situation
  - G. Kinetic Case Diagram
  - H. Comparison with Experiment
- VIII. Microheterogeneous Electrocatalytic Systems
  - A. Introduction
  - B. Model
  - C. Conducting Polymer-Microparticulate Metal Composite Systems
  - D. Ionomer-Mediator-Microparticle and Redox Polymer-Microparticle Composite Systems
  - E. Microheterogeneous Systems: Development of Optimal Strategy for Electrocatalysis
- IX. Concluding Comments

## CONTENTS

- I. Introduction
- II. Conformations and Critical Phenomena
  - A. Self-Avoiding Walks on Fractal Lattices
    - 1. Scaling Laws and Mean-Field Theories
    - 2. Fisher–Harris Criterion
  - B. Polymers on Diluted Lattices and in Porous Media
    - 1. Mean-Field Theory: Replica Method
    - 2. Mean-Field Theory: Flory Approach
    - 3. Simulations and Finite-Size Scaling
  - C. Disorder Effects on Phase Transitions
    - 1. Adsorption on Heterogeneous Surfaces
    - 2. Disorder-Induced Adsorption
    - 3. Liquid Crystalline Polymers in Porous Media
- III. Diffusion and Trapping
  - A. Anomalous Diffusion
    - 1. Monte Carlo Simulations
    - 2. Fractality and Crossover Scaling
  - B. Entropic Barrier Model for Polymers
    - 1. Diffusion in Random Media and Polymer Liquids
    - 2. Electrophoresis
