1. AN INTRODUCTION AND SOME BASIC THEORY	1
1.1 Introduction	1
1.1a Particle motion in phase space, 1	
1.1b The Hamiltonian form of the equations of motion, 4	
1.1c Conservation in phase space, 7	
1.1d Phase-space diagrams for multidimensional systems, 11	
1.1e The optical analogy, 14	
1.2 Constants of the Motion	15
1.2a Transformation theory of mechanics, 15	
1.2b The integral invariants, 20	
1.2c Action-angle variables, 24	
1.2d Equivalence of classical mechanics and geometrical optics, 27	
1.3 Phase-space conservation	29
1.3a Liouville's Theorem, 30	
1.3b Reduction to six dimensions for noninteracting particles, 33	
1.3c Reduction of Liouville's Theorem in the presence of interparticle forces, 35	
1.4 Theory of Oscillations	39
1.4a Conservative autonomous systems, 40	
1.4b A linear nonautonomous system, 41	
1.4c Linear differential equations with periodic coefficients, 42	

1.4d	Perturbation solutions to nonlinear autonomous equations, 45		
1.4e	Asymptotic expansions, 47		
1.4f	Method of averaging, 49		
2.	ADIABATIC INVARIANTS	53	
2.1	Adiabatic Invariance	53	
2.1a	Introduction, 53		
2.1b	Adiabatic invariance of the action integral, 54		
2.2	The Change in the Action Integral for Nearly Adiabatic Systems	57	
2.2a	Method of asymptotic expansions, 58		
2.2b	Method of direct computation, 66		
2.3	On the Minimization of the Increase in Effective Phase Space	70	
2.4	Adiabatic Invariants in Systems with More Than One Degree of Freedom	73	
2.4a	The use of adiabatic invariants, 73		
2.4b	The asymptotic formulation, 75		
2.4c	Adiabatic separation of the variables, 78		
2.4d	An example of the asymptotic method: the harmonic oscillator, 80		
2.4e	Amplitude functions and exact invariants, 83		
2.4f	Necessity of considering higher-order terms, and breakdown of adiabatic theory, 85		
3.	PHASE-SPACE TRANSFORMATIONS	92	
3.1	Basic Concepts	92	
3.1a	Discontinuous change in parameters, 92		
3.1b	Phase-space density distributions, 97		
3.2	Linear Transformations	99	
3.2a	Some consequences of linearity, 99		
3.2b	The method of ellipses, 103		
3.2c	Particle oscillations in a piecewise constant system, 106		
3.2d	Phase-space matching, 109		
3.3	Transverse Phase-space Transformations of Beams	111	
3.3a	Choice of variables, 112		
3.3b	Linear lenses, 113		
3.3c	Imaging and beam profiles for linear transverse lenses, 116		
3.3d	Stability, phase space, and beam envelope of a periodically focused beam, 121		
3.3e	Nonlinear lenses—an optical analogy, 124		
3.4	Longitudinal Phase-space Transformations: Nonlinear Effects	126	
3.4a	Outline of the problem, 126		
3.4b	Phase bunching, 127		
3.4c	Energy bunching, 133		
3.5	Phase-space Density Distributions within a Beam	134	
3.5a	Thermal velocity limit to current density, 135		
3.5b	Transverse cross sections and the effect of space charge, 141		
3.6	Coupling of Degrees of Freedom	144	
3.6a	Types of coupling, 144		
3.6b	Phase-space analysis of a particle velocity separator, 147		
3.6c	An example of the use of phase-space concepts in optics—design of a spectrometer, 152		
4.	PARTICLE DYNAMICS IN ACCELERATORS	158	
4.1	Betatron Oscillations	158	
4.1a	General description of oscillations in accelerators, 158		
4.1b	Free oscillations in axially symmetric circular accelerators, 160		
4.1c	Free oscillations in alternating gradient synchrotrons, 165		
4.1d	Betatron oscillations with a driving term, 168		
4.2	Synchronous and Coupled Oscillations; Effects of Radiation and Space Charge	173	
4.2a	Synchronous oscillations in linear accelerators, 174		
4.2b	Synchronous oscillations in synchrotrons, 179		
4.2c	Coupled oscillations, 184		
4.2d	Damping of oscillation amplitudes by radiation loss, 185		
4.2e	Hamiltonian formalism including space charge, 191		
4.3	Transverse Matching in Accelerators	193	
4.3a	Synchrotron acceptance, 193		
4.3b	Transverse focusing in linear accelerators, 196		

4.4	Longitudinal Matching	199
4.4a	Introduction, 199	
4.4b	Analysis of a linear accelerator bunching section, 200	
4.5	The Use of Density Distributions in Maximizing the Transfer of Particles	207
4.5a	Introduction, 207	
4.5b	Analytic treatment of two limiting cases, 209	
4.5c	Numerical determination of the optimum voltage, 212	
4.6	Multiturn Injection into Magnet Rings	215
4.6a	General considerations, 215	
4.6b	Phase-space packing in azimuthally symmetric accelerators, 217	
4.6c	Multiturn injection into an AG magnet ring, 219	
4.6d	Multiturn injection employing radiation damping, 222	
4.6e	Beam stacking in FFAG accelerators, 223	
5.	APPLICATIONS TO PLASMAS	228
5.1	Basic Considerations	228
5.1a	Adiabatic invariants of the motion, 228	
5.1b	The guiding center motion, 233	
5.1c	Equivalence of gyromotion with harmonic oscillator, 236	
5.1d	Higher-order invariance, 238	
5.1e	Some general remarks on nonadiabatic behavior, 240	
5.1f	Nonadiabatic variation of the field, 241	
5.1g	Dynamics of a Vlasov plasma, 244	
5.2	Containment I: The Dipole Field	248
5.2a	Formulation of the problem, 249	
5.2b	Method of action integrals, 251	
5.2c	Generalized coordinates and equilibria, 257	
5.3	Containment II: Laboratory Plasmas	260
5.3a	Introduction, 260	
5.3b	Symmetric poloidal fields, 264	
5.3c	Approximate solution for the motion of a particle in a mirror machine, 268	
5.3d	Motion in confining fields without azimuthal symmetry, 275	
5.3e	Numerical computations of the limits of adiabatic behavior, 279	

5.4	Plasma Heating	283
5.4a	Introduction, 283	
5.4b	Adiabatic compression, 284	
5.4c	Cyclotron resonance heating in a uniform magnetic field, 285	
5.4d	Cyclotron resonance interaction in mirror geometries: results of Hamiltonian perturbation theory, 287	
5.4e	Numerical computation of cyclotron interaction in mirror geometries: limits of adiabatic behavior, 290	
5.4f	Stochastic cyclotron resonance heating, 296	
5.5	Particle Injection into Containment Fields	300
5.5a	General considerations, 300	
5.5b	Injection by means of nonadiabatic fields, 303	
5.5c	Trapping times from phase-space arguments, 307	
	Appendix	314
	List of Symbols	319
	Index	323
