Preface	ix
Part 1: Linear MHD	1
<i>W M Manheimer and C N Lashmore-Davies</i>	
1 Experimental and observational evidence for MHD instabilities	3
2 Introduction to MHD	28
3 The energy principle	39
4 Free surface modes in a cylindrical plasma	49
5 Gravitational (g) modes in slab geometry	59
6 Resistive g modes	69
7 The tearing mode	74
8 Internal MHD instabilities in cylindrical plasmas	89
9 Instabilities in a toroidal plasma	111
Part 2: Non-linear MHD	117
<i>W M Manheimer</i>	
10 Quasi-linear theory of MHD instabilities	119
11 Quasi-linear theory and simplified non-linear theory of tearing modes	129
12 Steady-state quasi-linear theory of resistive g modes	139
13 Island overlap and the onset of stochasticity	144
14 The Taylor–Woltjer theory of spontaneous field reversal and current limitation	151
15 Kadomtsev’s theory of internal disruptions and introduction to numerical simulations	163
	vii

Part 3: Trapped-particle Instabilities and Anomalous Transport	173
<i>W M Manheimer</i>	
16 Effects of transport on tokamak discharges	175
17 Drift waves in an inhomogeneous plasma	192
18 Drift waves destabilized by a small population of trapped electrons	196
19 Shear stabilization of drift-wave instabilities	203
20 A collection of formulae concerning the magnetic field and particle orbits in a torus	211
21 Vlasov theory of the trapped-electron response	215
22 Variational calculation of eigenfunctions and eigenvalues	221
23 Anomalous transport from trapped-particle instabilities	230
24 The marginal stability approach	241
25 Stabilization by mode coupling	251
26 Scaling laws for transport coefficients	260
27 Particle simulations	264
Appendices	269
A Derivation of ideal MHD instability of a cylindrical plasma	271
B Additional properties of drift waves	274
C Energy and momentum in waves	279
D Additional properties of the trapped-electron response	288
E Additional aspects of cross-field energy flux	290
Index	293
