<b>B. COPPI and F. SANTINI — Analogy between turbulent transfer in velocity space and plasma collisional transport in real space . . . . .</b>	<b>55</b>
<b>C. MERCIER and H. LUC — The magnetohydrodynamic approach of plasma confinement in closed magnetic configurations . . . . .</b>	<b>63</b>
PREFACE	
CHAPTER 1 — Toroidal magnetic configurations for plasma confinement. Magnetostatic equilibrium	
1.1. Toroidal configurations and their topology	
1.2. Natural coordinates	
1.3. Equilibrium in the case of axisymmetry	
CHAPTER 2 — Magnetic stability	
2.1. Energy principle	
2.2. Localised displacements	
2.3. Localised criterion of the first kind	
2.4. The localised criterion of the second kind	
CHAPTER 3 — Some methods for solving toroidal MHD equations	
3.1. Intrinsic coordinates	
3.2. The method of expansion in powers of the distance to the magnetic axis	

- 3.3. The method of expansion in powers of the curvature
- 3.4. The method of helicoidal images
- CHAPTER 4 — Axisymmetric magnetic configurations
- 4.1. Equilibrium plasma-vacuum
- 4.2. Stability
- 4.3. Expansion in the neighbourhood of a magnetic surface
- Appendix : MHD equations including resistivity in the axisymmetric case and plasma diffusion
- References

**D. PALUMBO — Some properties of isodynamical equilibrium configurations and of their generalization . . . . . 91**

- 1. Introduction (and Abstract)
- 2. General aspects
- 3. Axisymmetrical case
- 4. Plane-symmetrical case
- 5. Stability of isodynamical axisymmetrical equilibrium configurations and of their generalization
- References

**T. E. STRINGER — Transport theory for toroidal plasmas . . . . . 109**

- 1. Introduction
- 2. The collision dominated plasma
  - 2.1. Resistive plasma
  - 2.2. Non-linear solution
  - 2.3. The resistive/viscous plasma
  - 2.4. Stability of ambipolar states
  - 2.5. Electron thermal conductivity
  - 2.6. Competition between different effects
- 3. The intermediate collisional regime
  - 3.1. Solution of kinetic equation
  - 3.2. Physical explanation
  - 3.3. Inclusion of the poloidal electric field
  - 3.4. Other transport coefficients
- 4. The "BANANA" regime
  - 4.1. Trapped particle orbits
  - 4.2. Physical origin of the diffusion
  - 4.3. The kinetic equation
  - 4.4. Other transport coefficients
- 5. Transport theory for Stellarators
  - 5.1. Collision dominated and intermediate regimes
  - 5.2. "BANANA" regime
- References

**H. P. EUBANK — Problems in plasma physics . . . . . 145**

- 1. Neutral beam injection
  - 1.1. Introduction
  - 1.2. Ion beam production and neutralization
  - 1.3. Beam absorption by the plasma

- 1.4. Energy deposition
- 1.5. Hybrid confinement geometries
- References
- 2. Plasma heating by parametric instabilities
- References
- 3. Review of far infrared laser technology and some plasma applications
- References
- 4. Determination of plasma ion temperatures from fast neutral atom emission
- References
- 5. Plasma measurements with particle beams
  - 5.1. Introduction
  - 5.2. Binary beam plasma interactions
  - 5.3. Ion density
  - 5.4. Electron temperature
  - 5.5. Collective effects
- References

**G. VON GIERKE — Review of low- $\beta$  toroidal machines . . . . . 191**

- 1. Introduction
- 2. Systems of toroidal experiments and general features
- 3. Internal conductor devices
- 4. Stellarators
  - 4.1.  $l = 2$  stellarators
  - 4.2.  $l = 3$  stellarators
- 5. Tokamaks
  - 5.1. The main properties of a Tokamak discharge
  - 5.2. Equilibrium and stability of Tokamak discharges
  - 5.3. The effect of non-axisymmetry
  - 5.4. Final conclusions
- References

**E. CANOBBIO — The neoclassical theory of transit time magnetic pumping (TTMP) in toroidal geometry . . . . . 243**

- 1. Introduction
- 2. A discussion of the physical principles
- 3. The model
- 4. The linear theory
- 5. The non-linear theory
- 6. TTMP and toroidal confinement
- References

**W. HOOKE — Selected topics in radio frequency heating of toroidal plasmas . . . 267**

- 1. Introduction
- 2. Ohmic heating
- 3. Radio frequency heating
  - 3.1. Power available

- 3.2. Ion cyclotron heating
  - 3.2.1. General considerations
  - 3.2.2. Stellarator results
    - a) Mode X and coupling efficiency
    - b) Decrease in coupling at high power levels
    - c) Effect of RF on containment
    - d) Wave heating efficiency
    - e) Ion cyclotron wave heating results electron heating
    - f) Ion heating
    - g) Heating with fast hydromagnetic waves
    - h) Plasmas consisting of two ion species
  - 3.2.3. Some problems with RF heating on Tokamaks
    - a) Lack of theoretical understanding of normal modes in a torus
    - b) Lack of axial magnetic beach
    - c) The short wavelengths in high density plasma
  - 3.2.4. RF heating on the Omega device
  - 3.2.5. The proposal of Adam and Samain
    - a) Two ion species
    - b) Heating at  $\omega = 2 \omega_{ic}$
  - 3.2.6. Conclusions
- 3.3. Lower hybrid resonance heating
  - 3.3.1. General considerations
  - 3.3.2. Experimental situation
    - a) Low power experiments
    - b) Experiments on plasma heating
