CHAPTER 1. THE PARTICLE KINETICS OF PLASMAS

1-1	Plasmas and plasma physics	1
1-2	Plasma kinetics	7
1-2.1	Plasmas and gases: localized equations	7
1-2.2	Velocity distribution function and the Boltzmann equation	9
1-2.3	The Vlasov equation	11
1-2.4	Velocity moments and related equations	11
1-2.5	Collisions and the distribution function	13
1-2.6	Cold electron momentum equation	13
1-2.7	Long-range Coulomb forces in plasmas	14
1-2.8	The Fokker-Planck equation	16
1-2.9	The Liouville equation	17
1-3	Interaction of electromagnetic fields with plasmas	19
1-3.1	Electron flow and current in plasmas	19
1-3.2	The electromagnetic field	21
1-3.3	Waves in cold plasmas	22
1-4	Plasma properties in the presence of static magnetic fields	25
1-5	Limit of validity for cold plasma wave equations; thermal effects negligible	27
1-6	Collisional plasma heating by electric fields	28
1-7	Diffusion	31
1-8	Summary	35
1-9	Useful numbers	41

CHAPTER 2. THE BOLTZMANN EQUATION

2-1	The Boltzmann equation	46
2-2	Preliminary remarks on solving the Boltzmann equation	49

2-3	Transport quantities—definitions	51
2-4	Collision terms—definitions	55
2-5	Boltzmann's transport equation and the conservation equations	57
2-6	The collision terms	62
2-7	The expansion of the distribution function	64
2-8	The Liouville equation	65
CHAPTER 3. EXPANSION OF THE ELECTRON DISTRIBUTION FUNCTION: SPHERICAL HARMONICS AND TIME HARMONICS		
3-1	Historical and introductory	70
3-2	Elastic collision theory	73
3-3	First-order expansion	77
3-4	Applications of the expanded equation	94
3-5	Equipartition of energy for nonsteady-state situations	104
3-6	Expansion to terms higher than $l=1$	109
3-7	Intrinsic velocity form for the Cartesian tensor equations	113
CHAPTER 4. APPLICATIONS OF THE BOLTZMANN EQUATION TO ELECTRON-ATOM INTERACTION		
4-1	General relations	119
4-1.1	Basic assumption and parameters	119
4-1.2	The basic relationships when no magnetic field is present	122
4-1.3	Basic relationships including a uniform static magnetic field	124
4-2	Constant collision frequency	127
4-3	Constant mean free path	128
4-4	Derivation of various distribution functions	129
4-5	Maxwellian distribution	138
4-6	Druyvesteyn distribution function	147
4-7	Constant mean free path and constant energy-loss factor the case of strong fields	149
4-8	Collision frequency and energy-loss factor proportional to some power of velocity. High- and low-frequency limits	153
4-9	Effective collision frequencies from magnetic field measurements	155
CHAPTER 5. ELASTIC COLLISIONS AND SCATTERING CROSS SECTIONS		
5-1	The mean free path of an electron based on kinetic theory	161
5-2	Total collision cross section, probability of collision, differential cross section, and total collision frequency	162

5-3	Probability of collision and collision frequency for momentum transfer	164
5-4	Experimental methods for determining collision cross sections of electrons with neutral particles	165
5-5	Collision cross sections of electrons with N ₂ , O ₂ , H ₂ , NO, CO ₂ , A, He, and Ne	175
5-6	The center-of-gravity system and the classical theory of scattering by a central force	189
5-7	Quantum-mechanical formulation of scattering	193
CHAPTER 6. BREMSSTRAHLUNG AND HIGH-FREQUENCY ELECTRICAL CONDUCTIVITY		
6-1	Particle trajectories in the classical treatment of electron-ion collisions	204
6-2	Total power radiated by an electron-ion encounter	208
6-3	Spectral dependence of bremsstrahlung	209
6-4	Bremsstrahlung at low frequencies	217
6-5	Average over impact parameters	218
6-6	Quantum-mechanical formulas	223
6-7	Bremsstrahlung from a Maxwellian distribution	228
6-8	The high-frequency electrical conductivity of a fully ionized plasma	236
CHAPTER 7. COULOMB COLLISIONS AND THE FOKKER-PLANCK EQUATION		
7-1	The Fokker-Planck Equation	243
7-2	Simple evaluation of the coefficients, valid for electron-ion collisions	251
7-3	The screening factor	258
7-4	Formulation of the Fokker-Planck equation in terms of Rosenbluth potentials	269
7-5	Relationships between, and evaluations of, the Rosenbluth potentials	273
7-6	The reduced Fokker-Planck equation and the Boltzmann equation	277
7-7	The transport conservation equations	285
7-8	Relaxation of an isotropic system of identically charged particles	295
7-9	Relaxation of an anisotropic pressure or temperature	298
7-10	Energy relaxation between electrons and ions	303
7-11	Relaxation of a fast ion in a plasma	307
CHAPTER 8. TRANSPORT PROPERTIES OF PLASMAS		
8-1	Conductivity for a slightly ionized gas	315
8-2	Conductivity when electron-ion effects are included	317

x TABLE OF CONTENTS

8-3	Form of the conductivity matrix including all interactions	318
8-4	Conductivity values for a highly ionized gas with a Maxwellian distribution	322
8-5	Conductivity for any degree of ionization with a Maxwellian distribution	328
8-6	Conductivity for a completely ionized gas including the ion motion	349
8-7	Transport coefficients for the direct current and energy flow in a completely ionized gas	361
8-8	The ion pressure tensor in a fully ionized plasma	374
8-9	Experimental determinations of the transport coefficients	384
8-10	Runaway and hysteresis	400
CHAPTER 9. THE FOUNDATIONS OF MAGNETO- HYDRODYNAMICS (MHD)		
9-1	Simple concepts from particle motion in uniform fields	422
9-2	Plasma dynamics: the velocity moments and the plasma equations	425
9-3	Magnetohydrodynamics (MHD) validity	435
9-4	Freezing of magnetic lines	448
9-5	MHD equilibria	451
9-6	Magnetohydrodynamic shock transition conditions	454
9-7	Hydrodynamics with viscosity: the Navier-Stokes relationship for plasmas	462
CHAPTER 10. COLLISIONLESS PLASMAS IN STRONG MAGNETIC FIELDS—THE CGL SYSTEM		
10-1	Development of the CGL pressure tensor	472
10-2	Momentum equation with CGL pressure	477
10-3	Single-particle transverse drift velocity	479
10-4	Total transverse current including polarization and magnetization	483
10-5	Longitudinal acceleration and the magnetic moment	487
10-6	Limitations of the CGL system	491
