Foreword	xi
Preface	xiii
Symbols and Notations	xiv
1. Introduction	1
References	9
2. Simple Non-linear Examples	10
Parametric instability	11
Three varying amplitudes	13
Linear and cubic terms	15
References	18
3. Coupled Mode Theory	19
Derivation of the Coupled Mode Equations	21
References	26
4. The Field Energy in Dispersive Media	27
General discussion of the field energy of a wave	27
Special forms of the expression for the field energy	31
References	34
5. Formulation of Non-linear Wave Equations in Terms of Non-linear Current	35
Basic non-linear field equations and higher order dispersive	
contributions	35
Effect of linear dissipation or growth	40
References	41
6. Some Examples of Three-Wave Interaction in Plasma	42
Hydrodynamic treatment,	
Interaction between three longitudinal waves.	44
Interaction between two transverse and one longitudinal wave	
propagating parallel to a magnetic field	45
Kinetic treatment	47
Interaction between three longitudinal waves	48
Discussion	49

Contents

References	50
Supplementary References	50
7. Energy Relations	60
Basic coupled mode equations	60
References	65
8. Negative Energy Waves	66
The beam-plasma system	66
Higher order effects	70
Discussion	71
References	72
9. Solutions to the Coupled-mode Equations	73
Formulation of basic equations and solution in terms of a	
non-linear potential	74
The case $s = -1$	78
The case $s = 1$	79
The case $u_0(0) = u_1(0) = u_2(0), \Gamma = \Delta \omega = 0$	80
The phase variation	80
Phase locking in the case $s = 1$	81
Phase plane description	82
Variation in time and space	84
Discussion	84
References	84
10. Stability Criteria and Asymptotic Behaviour for a General System of Three	2
Interacting Waves	85
Properties of the wave solutions of the coupled system	
in a stationary medium	86
Time-dependent medium	92
The dissipation-free case	93
Influence of the frame of reference	94
References	97
11. The Problem of Mutually Different Imaginary Parts of the Frequencies in Explosively Unstable Case	. the 98
Approximate solution for a stationary medium	99
Time-dependent medium	101
Asymptotic expansion	102
Special cases	102

vi

Contents	vii
	,
References	103
12. The Influence of Mutually Different Linear I	Damping Coefficients on a System of
Three interacting waves of Equal Signs of Energy	104
Damping different for each wave	104
One wave only damped	112
Weakly damped case	116
Strongly damped case	116
The case $\Gamma \neq 0$	118
Discussion	120
References	120
13. The Explosively Unstable Interaction Between	n two Electromagnetic Waves and
Three Plasma Waves	121
The coupled systems	121
Equations of motion	121
Constants of motion and analytic solu	tion 123
References	126
14. Third Order Non-Linear Effects and the Stab	ilization of Explosive Instabilities
Explosive Instabilities	127
General discussion of the influence of	of third order effects 128
Formulation of the third order non-li	near coupled equations 130
The dissipation-free case	133
Soliton solution	135
Formulation of the problem in terms	of a non-linear
potential π	137
General solution	139
Properties of the potential π	141
Hamiltonian formulation	145
The limit $\beta_i \neq 0$	146
J References	149
Supplementary References	149
15. The Influence of Dissipation in the Presence	of Third Order Non-linear Effects
Non-linear Effects	150
The influence of linear dissipation w	then all $\Theta_{i,i} = 0$ 151
Calculation of Γ_{122}	ມ 154
eii Asymptotic behaviour	156
Effective non-linear dissipation	159

Contents

	Phase-locking	160
	Second-order coupling factors with different phase angles	160
	The dynamic process of phase-locking	169
	The effect of a linear dissipation	171
	Effective non-linear dissipation	174
	References	175
16.	Numerical Calculation of the Coupling-factors for three Explosively	
	Unstable Waves in a Beam-Plasma System	176
	Assumptions and models used in the calculations	176
	Hydrodynamical model	178
	Kinetic model	180
	Numerical calculation of the coupling factors	181
	Numerical values of the parameters	183
	Numerical results	184
	The variation of u _b	184
	The variation of V_{ob}	188
	The variation of $\widetilde{\mathtt{N}}_{\mathrm{b}}$	189
	The variation of $ {f \widetilde{k}}_0 $	195
	Numerical solution of the coupled mode equations	195
	Numerical parameters values	195
	Numerical solution	196
	Discussion	199
	References	199
17.	Second-Order Dispersive Effects	200
	Formulation of the problem	200
	Qualitative behaviour of the solutions	202
	Influence of the initial conditions	204
	Evolution of the oscillations	205
	Resonant interaction between the oscillations	206
	Influence of dissipation	208
	Waves of equal wave energy signs	209
	The limit $\delta_i \rightarrow 0$	209
	Discussion	210
	References	211
18.	Interaction Between Waves with Finite spread in Wave Vectors	212
	Wave vector packets	213

viii

	The time of coherence	213
	Interaction between wave packets	214
	Equations of motion for three wave packets and constants	
	of motion	217
	Comparison with the coherent interaction of three waves	220
	The broadening and depletion of a pump wave penetrating	
	a plasma	224
	Development of a small phase-spread	230
	Discussion	231
	References	232
	Supplementary References	232
19.	Non-linear Excitation of Collective Waves in Plasmas by Means of Strong External Electromagnetic Radiation	
	Stimulated Scattering	234
	Effects of high power illumination of a plasma	234
	Studies on stimulated backscattering	236
	Excitation of purely growing modes and modulation	
	of the density profile	237
	References	242
	Supplementary References	244
20.	Parametric Excitation of Hybrid Resonances in Plasmas	
	Containing Impurity Ions	251
	Basic assumptions	251
	The basic equations for the wave-wave coupling	252
	The dispersion relation and its solution	254
	Growth rates and thresholds	258
	References	262
	Supplementary references	263
21.	Non-resonant Wave-Wave Interaction and Wave-Particle Effects	265
	Analysis of the coupling problem	265
	References	270
	Supplementary References	271
22.	Experiments on Non-linear Effects in Plasmas	272
	Early experiments	272
	Further laboratory experiments	273

Computer simulation experiments

Referenc	es
23. Trends in th	e Development of Non-linear Plasma Research
Referenc	ces
Appendix I. Sor	me Different Types of Waves in Plasmas
	Plasma without magnetic field
	Electromagnetic waves
	Plasma waves
	Ion acoustic waves
	Plasma with magnetic field
	Propagation along the magnetic field
	Propagation perpendicular to the magnetic field
	References
Appendix II. A	Derivation of the Coupled-mode Equations in a Kinetic Description
	References
Appendix III. /	A Method for Finding the Resonance Points in a Magnetized Plasn
	The resonance conditions
	Cold magnetized plasma with immobile ions
	Fulfilment of the resonance conditions
	Extremum points for $f(k_0, k_1)$
	References
Appendix IV. /	A Derivation of Equations Describing Modulational Instability
Appendix V. M	lathematical Methods in the Theory of Non-linear Perturbations
