<i>Preface (in French and English)</i>	<i>xiii</i>
<i>Course 1. Laser fusion experiments at Lawrence Livermore Laboratory, by Harlow G. Ahlstrom</i>	<i>1</i>
1. Introduction	4
2. Diagnostic instrumentation	12
2.1. Laser output measurements and target alignment	18
2.2. Optical instruments	34
2.3. X-ray diagnostics	52
2.4. Particle diagnostics	100
3. Laser fusion program and facilities at LLL	135
4. Laser-plasma interaction and energy transport	168
5. Implosion experiments	221
6. Projections of the future	265
References	280
<i>Seminar 1. Recent experiments on laser-plasma interaction carried out at Soreq, by Shalom Eliezer</i>	<i>289</i>

<i>Course 2. Physics of the coronal plasma in laser fusion targets, by Claire Ellen Max</i>	301
1. Physical conditions in the corona	304
1.1. Typical temperatures near the critical surface	305
1.2. Typical velocities in the corona	306
1.3. Gradient scale lengths in the corona	307
1.4. Plasma parameters	309
2. Mechanisms for laser light absorption	310
2.1. Inverse Bremsstrahlung absorption	310
2.2. Resonance absorption	317
2.3. Absorption due to ion-acoustic turbulence	323
3. Stimulated scattering and filamentation: non-linear evolution	326
3.1. Stimulated Brillouin scattering	327
3.2. Stimulated Raman scattering and two-plasmon decay instability	343
3.3. Filamentation and self-focusing	347
4. Inhibition of electron thermal conduction	356
4.1. Introduction and basic concepts	356
4.2. dc magnetic fields	360
4.3. Ion-acoustic turbulence	362
4.4. Weibel instabilities	366
4.5. Improved calculations of “classical” heat flux	368
5. Production of large dc magnetic fields	373
5.1. Experimental evidence	373
5.2. Mechanisms resulting in large-scale B fields	375
5.3. Mechanisms producing small-scale B fields	379
5.4. Heat transport in realistic B -field geometries	382
6. Scaling of physics processes with laser wavelength	387
6.1. Plasma physics and laser–plasma coupling	387
6.2. Hydrodynamics and implosion physics	395
References	405
<i>Course 3. Parametric instabilities, by René Pellat</i>	411
Introduction	414
1. The modulational Brillouin and Raman instabilities	415
1.1. Decay of an electrostatic pump into a Langmuir and an ion sound wave	415
1.2. Parametric decay of an electromagnetic wave	424
Appendix 1.1. The detailed justification of the Zakharov equations	431
Appendix 1.2. The Silin dispersion relation	434

Appendix 1.3. Parametric instabilities due to the relativistic mass oscillation	436
2. Pump of finite extension in inhomogeneous plasmas	440
2.1. Envelope equations for parametric instabilities	440
2.2. Inhomogeneous plasma, with an inhomogeneous pump field	446
2.3. The Raman backscattering and the two plasmon decay in the vicinity of $n_c/4$	452
Appendix 2.1. An account of the WKBJ theory	457
3. Adiabatic effects: The consequences of inertial confinement in electron phase space	461
3.1. Introduction	461
3.2. The collisionless limit ($C(f) \equiv 0$)	465
3.3. Collisional plasma	467
3.4. The different regimes for magnetic field generation. Numerical results	472
4. Non-linear behaviour of the modulational instability	475
4.1. Plasma condensation in one density cavern	479
4.2. "Turbulent" Langmuir condensation	483
References	491

Seminar 2. The ponderomotive force and applications to laser-plasma interaction, by George Schmidt	495
---	------------

Course 4. Particle simulation: theory and applications, by Jean-Claude Adam	503
Introduction	506
1. Basic concepts of particle simulation	506
2. Physics of a one-dimensional numerical plasma	511
2.1. Effect of finite size on the longitudinal oscillations	511
2.2. Grid effects	516
2.3. Effect of finite time step	518
3. Practical implementation of a 1D electrostatic model	518
3.1. Set up of the system	519
3.2. Charge repartition	520
3.3. Poisson solver	520
3.4. Particle pusher	521
3.5. Diagnostics	522
3.6. Capacitor model of resonant absorption	522

4. Two-dimensional electromagnetic models	526
4.1. Time integration of the Maxwell equations	526
4.2. Solving the Poisson equation in 2D	529
4.3. Open ended boundary conditions	529
4.4. Particle pusher	531
4.5. Coupling the Maxwell equations and the particle pusher	532
4.6. Relativistic extension	533
4.7. An application to the problem of resonant absorption	534
References	537

Course 5. Principles of laser confinement fusion,

by Keith A. Brueckner

539

1. Introduction	542
2. Analytic estimates of energy production	542
2.1. Scaling laws	542
2.2. Uniform sphere with compression and self-heating	545
2.3. Non-uniform compressed sphere with self-heating and propagation	550
2.4. Compression by shocks	553
2.5. Quasi-adiabatic compression of spheres and shells	561
3. Problems of implosion physics	568
3.1. Hydrodynamic stability of a laser-driven plasma	568
3.2. Fast-electron production in laser-heated plasmas	577
3.3. Production of fast ions in laser-heated plasmas	589
4. Wavelength-dependent phenomena	600
4.1. Radiation-produced forces in laser-heated plasmas	600
4.2. Wavelength dependence of laser coupling to pellet implosions	604
4.3. Preheat	608
5. Interaction and propagation of heavy ion beams	609
5.1. Stopping power for energetic ions in solids and plasmas	609
5.2. Filamentation instability in heavy ion beams	622
References	641

Course 6. Statistical mechanics of dense plasmas,

by Jean-Pierre Hansen

645

1. Introduction	648
1.1. The physics	648

1.2. The models	652
1.3. Theoretical tools and scope of lectures	656
2. Stability and thermodynamic limit	657
2.1. Qualitative discussion	657
2.2. An illustration: H -stability of the OCP	659
2.3. Lower bounds to the OCP thermodynamics	662
3. Static correlation functions	663
3.1. Definitions and fundamental properties	664
3.2. Long wavelength behaviour	667
3.3. Hypernetted chain theory	672
3.4. Enhancement of thermonuclear reaction rates	679
4. Equation-of-state and phase transitions	682
4.1. The e.o.s. of degenerate plasmas	682
4.2. Crystallization	686
4.3. Miscibility of binary ionic mixtures	687
5. Time-dependent correlation functions	692
5.1. Definitions and general properties	692
5.2. Longitudinal and transverse collective modes	698
5.3. Projection operators and memory functions	703
5.4. Plasma oscillations in the OCP	707
5.5. Plasma oscillations in the TCP	712
6. Kinetic theory	717
6.1. An exact kinetic equation for the study of equilibrium fluctuations	718
6.2. Hydrodynamic modes	722
6.3. Transport coefficients of the OCP	723
6.4. Electrical conductivity of the TCP	725
References	729

<i>Course 7. Atoms in very strong fields, by Daniel Kleppner</i>	733
1. Introduction	736
2. The structure of atoms in strong electric fields	736
2.1. Background: the second order Stark effect	737
2.2. Stark shifts in Rydberg states	738
2.3. The Stark structure of hydrogen	739
2.4. Stark structure of the alkali-metal atoms	750
3. Ionization processes in a static electric field	758
3.1. Classical considerations	758
3.2. Tunneling and field ionization	762
3.3. Discrepant views of field ionization	765
3.4. Resolution of the discrepant views	766

4. Atoms in strong magnetic fields	769
4.1. Background	769
4.2. The basic Hamiltonian	770
4.3. Low field solution	771
4.4. Very high field solution	773
4.5. The quasi-Landau resonances	778
4.6. Intermediate field behavior	779
4.7. The possibility for a complete solution	782
References	784
 <i>Course 8. The Korteweg–de Vries equation, by Martin Kruskal</i>	785
1. Introduction	788
2. Solitary wave solutions of equations	788
3. The KdV equation and Burgers' equation	790
4. Conservation laws for KdV	794
5. Miura and Bäcklund transformations	795
6. Generation of conservation laws	797
7. KdV and the time-independent Schrödinger equation	798
7.1. The Lax pair	799
7.2. Explicit solutions and multi-solitons	800
8. Inverse scattering theory	802
9. Polar representation of solutions	806
10. The Painlevé property	807
References	807
