PREFACE	vii
1. Lightning in History H. PRINZ	
1. Introduction	1
2. Mythological symbols and rites	1
3. Learned opinions and curiosities of antiquity	5
4. Sparks and lightning	6
5. Lightning experiments	9
6. Kites, balloons, mortars and rockets	12
7. Protection against lightning	14
8. Simulating lightning	16
9. Epilogue	20
References	20
2. Benjamin Franklin B. DIBNER	
1. Introduction	23
2. Points and clouds	23
3. "Experiments and observations"	28
4. The sentry-box and Marly experiments	30
5. The kite	34
6. The lightning rod	37
7. The lightning rod in Europe	43
References	48
3. The Thundercloud C. B. MOORE and B. VONNEGUT	
1. Introduction	51
2. Thunderstorm occurrence	52

3. Developments of thunderclouds	54
3.1 Convection	54
3.2 Precipitation	63
3.3 Electrification	70
4. Electrical conditions around thunderclouds	73
4.1 Conduction	73
4.2 Point-discharge currents	78
4.3 Charge transported by precipitation	79
4.4 Charge distribution in thunderclouds	80
4.5 The electric field intensities necessary to produce lightning	84
5. Cloud electrification mechanisms	85
5.1 Precipitation-powered processes	85
5.2 Convective electrification mechanism	87
5.3 Explanations based on the contact differences of potential	88
5.4 Requirements for a satisfactory explanation of cloud electrification	89
6. Modification of thunderclouds	90
7. Summary	92
Acknowledgements	92
References	93
 4. Point-discharge	
J. LATHAM and I. M. STROMBERG	
1. Introduction	99
2. The mechanism of point-discharge	100
3. Point-discharge from artificial points	101
4. Point-discharge at the ground	103
5. Corona at the ocean surface	107
6. Corona discharges within thunderclouds	111
References	115
 5. The Earth Flash	
K. BERGER	
1. Early investigations	119
1.1 Magnetic-link measurements	119
1.2 The fulchronograph	120
1.3 The klydonograph	120
1.4 The cathode-ray oscilloscope	120

2. Lightning recording at a distance	121
2.1 General	121
2.2 Temporal characteristics of lightning flashes	128
3. Types of lightning discharge	134
3.1 Definitions	134
3.2 Description of lightning types	134
4. Results of lightning research and recording stations	138
4.1 Methods of recording lightning currents	138
4.2 The Empire State Building	139
4.3 Mount San Salvatore	140
4.4 Other recording stations	165
5. Physical picture of the earth flash	167
5.1 Charge distribution in a thundercloud	167
5.2 Point-discharge	168
5.3 Transition from corona to leader arc	169
5.4 The stepped leader	173
5.5 Transition from leader to return stroke	175
5.6 The first return stroke	178
5.7 The multiple flash	181
5.8 Subsequent strokes	182
5.9 Discharge of positive clouds	183
5.10 Stroke potential and energy in lightning flash	184
6. Outlook	186
References	187
 6. The Cloud Discharge	
M. BROOK and T. OGAWA	
1. Introduction	191
1.1 General remarks	191
1.2 Methods of investigation	192
2. The electric field and charge distribution	193
2.1 Observed fields	193
2.2 The electric field produced by simple charge distributions	195
3. Electric field-changes	196
3.1 Observed data	196
3.2 The cloud flash model	197
3.3 Heights of the charges	199
3.4 Values of charge and moment change	201
4. Initial cloud-discharge streamer	206
4.1 Classification of electric field-change patterns	206

4.2 The initial streamer	207	2.2 Slitless spectrometers	284
4.3 Multistation measurements	213	2.3 Spectrometers using photoelectric detectors	292
4.4 Tilted streamer	213	2.4 Calibration techniques	293
5. K changes	217	3. Quantitative analyses	294
5.1 Observation	217	3.1 Introductory remarks	294
5.2 Characteristics of the K changes	219	3.2 Theory	294
6. Photographic analyses	220	3.3 Results of stroke-resolved spectroscopy	298
7. Radiation from cloud flashes	222	4. Future experiments	305
8. Summary and conclusions	226	References	306
References	228		
7. The Long Spark		9. Lightning Currents and Related Parameters	
T. E. ALLIBONE		R. H. GOLDE	
1. Introduction	231	1. Historical survey	309
2. Sparkover under unipolar lightning impulse voltages and switching impulse voltages	233	1.1 General	309
2.1 General description of breakdown characteristics	233	1.2 Early estimates	310
2.2 Sparkover of rod/plane, rod/rod and sphere/plane gaps under lightning impulse voltages	234	2. Time resolution of lightning current	312
2.3 Sparkover under switching impulses	237	3. Current amplitude	314
2.4 Breakdown of a "window" gap surrounding a transmission line	244	3.1 Introductory remarks	314
2.5 Sparkover between two phase conductors separately stressed	245	3.2 Downward discharge	315
2.6 Effect of air density and humidity	245	3.3 Upward discharge	323
2.7 Time-lags, standard deviations and withstand voltages	247	4. Current wave-shape	324
3. Sparkover under alternating and constant voltages	248	4.1 Downward discharge	324
4. Physical mechanism of spark formation	249	4.2 Upward discharge	335
4.1 The leader stroke/main stroke mechanism	249	5. Related parameters	336
4.2 The positive leader stroke	257	5.1 Charge	336
4.3 The rod/plane discharge of negative polarity	269	5.2 Electric moment	340
4.4 The sphere/plane discharge	271	5.3 Action integral and energy	341
5. Future problems	271	6. Correlation of parameters	343
References	275	7. Outlook	344
		Acknowledgements	344
8. Lightning Spectroscopy		References	345
R. E. ORVILLE			
1. History	281	10. Atmospherics and Radio Noise	
2. Experimental techniques and qualitative results	283	E. T. PIERCE	
2.1 Slit spectrometers	283	1. Definitions and introduction	351
		2. Atmospherics due to lightning	352
		2.1 General	352
		3. Atmospherics due to lightning—source effects	353
		3.1 General	353
		3.2 Signals at frequencies less than 300 kHz	357
		3.3 Signals at frequencies exceeding 300 kHz	363

4. Atmospherics due to lightning—propagation effects	364
4.1 Propagation at frequencies of less than 300 kHz	364
4.2 Propagation at frequencies exceeding 300 kHz	367
4.3 Summary	367
5. The location of distant thunderstorms	369
5.1 Introduction	369
5.2 Multistation systems	370
5.3 Single-station methods	371
5.4 Summary	373
6. Radio noise and special topics	373
6.1 Radio noise—general	373
6.2 Whistlers	376
6.3 Satellite measurements	377
6.4 Schumann resonances	379
6.5 Special noise sources	380
6.6 The electromagnetic pulse	380
Acknowledgements	381
References	381

11. Thunder**R. D. HILL**

1. Introduction	385
2. Experimental techniques and observations	386
2.1 Techniques prior to 1960	386
2.2 Techniques after 1960	387
2.3 Most recent techniques and results	388
3. Theories of thunder	393
3.1 General concepts	393
3.2 Lightning channel theory of thunder generation	393
3.3 Generation of thunder	395
4. Infra-sound	401
4.1 Observations	401
4.2 Theories of infra-sound generation	403
5. Other topics associated with thunder	405
Acknowledgements	405
References	406

12. Ball Lightning**S. SINGER**

1. Properties	409
-------------------------	-----

2. Theories	412
3. Scepticism toward ball lightning	414
3.1 General considerations	414
3.2 Photographic evidence	415
3.3 Optical illusions	417
3.4 Ball lightning versus other atmospheric phenomena	418
4. Recent studies of ball lightning theories	420
4.1 General survey	420
4.2 Kapitsa's radio-frequency theory	420
4.3 Plasma properties	423
4.4 Nuclear theories	425
4.5 Miscellaneous characteristics	428
4.6 Coherent radiation theories	428
4.7 Formation of ball lightning by an earth flash	429
5. Outlook	433
Acknowledgements	433
References	433

13. Measuring Techniques**R. B. ANDERSON**

1. Introduction	437
2. The electric field	437
2.1 Principle of measurement	437
2.2 Electrostatic field strength measurements	438
3. The electric field-change	448
3.1 The electrostatic field-change	448
3.2 The electromagnetic field-change	452
4. Wave-shapes of lightning currents	455
5. Lightning flash density	457
5.1 Spherics	457
5.2 Lightning flash counters	458
6. Conclusions	461
Acknowledgements	461
References	462

14. Frequency of Lightning Discharges**S. A. PRENTICE**

1. Introduction	465
2. Lightning incidence in space and time	466
2.1 General	466

2.2 Methods of determination of lightning incidence	469
2.3 Data on lightning incidence	471
2.4 Discussion	477
3. Relationships between lightning incidence and other parameters	480
3.1 General	480
3.2 Lightning incidence and thunderstorm statistics	480
3.3 Lightning incidence and geographic latitude	482
3.4 Lightning incidence and precipitation	484
3.5 Discussion	485
4. Ratio of cloud flashes to ground flashes	485
4.1 General	485
4.2 Fundamental considerations	486
4.3 Estimates of ratio	486
4.4 Empirical relationships	486
4.5 Discussion	488
5. Effect of height of object and terrain on incidence of ground flashes	488
6. Deficiencies in knowledge	491
References	492
