

## CONTENTS

### 1 ENERGY CONVERSION

1.1	Introduction . . . . .	1
1.2	Energy conversion and energy sources . . . . .	3
1.3	Energy conversion and heat engines . . . . .	8
1.4	Direct energy conversion schemes . . . . .	12
1.5	New sources and economical development . . . . .	15
1.6	Transmission and storage of energy . . . . .	18
1.7	Direct energy systems and applications . . . . .	21
1.8	Economic aspects of power generation . . . . .	26
1.9	Future trends . . . . .	27

### 2 PHYSICAL PRINCIPLES

#### A THERMODYNAMICS

2.1	Heat and work . . . . .	35
2.2	The first law of thermodynamics . . . . .	37
2.3	Kinetic theory of gases . . . . .	37
2.4	Thermodynamic variables . . . . .	39
2.5	Reversible and irreversible processes . . . . .	39
2.6	The Carnot cycle . . . . .	39
2.7	The second law of thermodynamics and entropy . . . . .	41
2.8	The third law of thermodynamics . . . . .	42

#### B QUANTUM MECHANICS

2.9	Introduction . . . . .	43
2.10	Duality of light and matter . . . . .	43
2.11	The uncertainty principle . . . . .	44
2.12	Schrödinger's wave equation . . . . .	45
2.13	Discrete energy states . . . . .	46
2.14	Electron in field-free space . . . . .	46
2.15	Electron in a square-well potential . . . . .	47

<b>C SOLID STATE</b>																																																																																																																																																															
2.16 The electronic structure of matter . . . . .	50	5.8 Thermoelectric materials . . . . .	161																																																																																																																																																												
2.17 The Fermi factor . . . . .	50	5.9 Power output, losses, and efficiency . . . . .	166																																																																																																																																																												
2.18 Energy bands . . . . .	52	5.10 Thermoelectric systems . . . . .	168																																																																																																																																																												
2.19 Intrinsic semiconductors . . . . .	53	5.11 Applications and future trends . . . . .	173																																																																																																																																																												
2.20 Extrinsic semiconductors . . . . .	55																																																																																																																																																														
2.21 pn junctions . . . . .	55																																																																																																																																																														
2.22 Metals . . . . .	57																																																																																																																																																														
<b>D PLASMA PHYSICS</b>																																																																																																																																																															
2.23 Characteristics of a plasma . . . . .	58	<b>6 THERMIONIC POWER GENERATION</b>																																																																																																																																																													
2.24 Cross section and ionization . . . . .	59	2.25 Forces between charge carriers . . . . .	61	6.1 Introduction . . . . .	182	2.26 Boltzmann equation . . . . .	62	6.2 Thermionic emission . . . . .	183	2.27 Transport phenomena . . . . .	63	6.3 Thermodynamic analysis of thermionic emission . . . . .	185	<b>3 FUSION POWER</b>		6.4 Fermi-Dirac analysis of thermionic emission . . . . .	187	3.1 Introduction . . . . .	69	6.5 Different types of thermionic converters . . . . .	190	3.2 Conditions for nuclear fusion . . . . .	69	6.6 Thermionic materials . . . . .	200	3.3 Plasma confinement by magnetic fields . . . . .	73	6.7 Space charge neutralization . . . . .	203	3.4 Plasma instabilities . . . . .	74	6.8 Power output, losses, and efficiency . . . . .	206	3.5 Different approaches to nuclear fusion . . . . .	78	6.9 Thermionic systems . . . . .	210	3.6 Formation of plasmas . . . . .	92	6.10 Economic aspects and future trends . . . . .	211	3.7 Losses and efficiency in fusion devices . . . . .	93			3.8 Economic aspects and future trends . . . . .	97			<b>4 MAGNETOHYDRODYNAMIC POWER GENERATION</b>		<b>7 FUEL CELLS</b>		4.1 Introduction . . . . .	106	4.2 Gas conductivity . . . . .	107	7.1 Introduction . . . . .	222	4.3 Magnetohydrodynamic equations . . . . .	111	7.2 Thermodynamics of a fuel cell . . . . .	222	4.4 Operating range of an MHD duct . . . . .	114	7.3 Normal fuel cells and regenerative fuel cells . . . . .	225	4.5 Different types of MHD generators . . . . .	116	7.4 Performance characteristic $V = f(J)$ . . . . .	226	4.6 Magnetohydrodynamic materials . . . . .	124	7.5 Different types of fuel cells . . . . .	231	4.7 Production of magnetic fields . . . . .	128	7.6 Electrodes and electrocatalysts . . . . .	242	4.8 Power output, losses, and efficiency . . . . .	129	7.7 Power output and efficiency of a fuel cell . . . . .	244	4.9 MHD power generation systems . . . . .	133	7.8 Fuel cell batteries and systems . . . . .	247	4.10 Economic aspects and future trends . . . . .	136	7.9 Applications and future trends . . . . .	249	<b>5 THERMOELECTRIC POWER GENERATION</b>		<b>8 PHOTOVOLTAIC POWER GENERATION</b>		5.1 Introduction . . . . .	146	5.2 Thermoelectric effects . . . . .	146	8.1 Introduction . . . . .	259	5.3 Classical thermodynamic analysis of the thermoelectric effects . . . . .	148	8.2 Radiation energy . . . . .	260	5.4 Thermoelectric coefficients in semiconductor theory . . . . .	150	8.3 The photovoltaic effect . . . . .	261	5.5 General equations . . . . .	152	8.4 Different types of photovoltaic cells . . . . .	267	5.6 Thermoelectric devices . . . . .	153	8.5 Collection of solar radiation . . . . .	276	5.7 Different types of thermoelectric generators . . . . .	155	8.6 Cell fabrication . . . . .	278			8.7 Power output, losses, and efficiencies . . . . .	279			8.8 Photovoltaic batteries and systems . . . . .	282			8.9 Economic aspects and future trends . . . . .	283			<b>9 ELECTROHYDRODYNAMIC POWER GENERATION</b>						9.1 Introduction . . . . .	292			9.2 Ion mobility . . . . .	293			9.3 EGD equations . . . . .	295			9.4 EGD devices . . . . .	296			9.5 Different types of EGD power generators . . . . .	299
2.25 Forces between charge carriers . . . . .	61	6.1 Introduction . . . . .	182																																																																																																																																																												
2.26 Boltzmann equation . . . . .	62	6.2 Thermionic emission . . . . .	183																																																																																																																																																												
2.27 Transport phenomena . . . . .	63	6.3 Thermodynamic analysis of thermionic emission . . . . .	185																																																																																																																																																												
<b>3 FUSION POWER</b>		6.4 Fermi-Dirac analysis of thermionic emission . . . . .	187																																																																																																																																																												
3.1 Introduction . . . . .	69	6.5 Different types of thermionic converters . . . . .	190																																																																																																																																																												
3.2 Conditions for nuclear fusion . . . . .	69	6.6 Thermionic materials . . . . .	200																																																																																																																																																												
3.3 Plasma confinement by magnetic fields . . . . .	73	6.7 Space charge neutralization . . . . .	203																																																																																																																																																												
3.4 Plasma instabilities . . . . .	74	6.8 Power output, losses, and efficiency . . . . .	206																																																																																																																																																												
3.5 Different approaches to nuclear fusion . . . . .	78	6.9 Thermionic systems . . . . .	210																																																																																																																																																												
3.6 Formation of plasmas . . . . .	92	6.10 Economic aspects and future trends . . . . .	211																																																																																																																																																												
3.7 Losses and efficiency in fusion devices . . . . .	93																																																																																																																																																														
3.8 Economic aspects and future trends . . . . .	97																																																																																																																																																														
<b>4 MAGNETOHYDRODYNAMIC POWER GENERATION</b>		<b>7 FUEL CELLS</b>																																																																																																																																																													
4.1 Introduction . . . . .	106	4.2 Gas conductivity . . . . .	107	7.1 Introduction . . . . .	222	4.3 Magnetohydrodynamic equations . . . . .	111	7.2 Thermodynamics of a fuel cell . . . . .	222	4.4 Operating range of an MHD duct . . . . .	114	7.3 Normal fuel cells and regenerative fuel cells . . . . .	225	4.5 Different types of MHD generators . . . . .	116	7.4 Performance characteristic $V = f(J)$ . . . . .	226	4.6 Magnetohydrodynamic materials . . . . .	124	7.5 Different types of fuel cells . . . . .	231	4.7 Production of magnetic fields . . . . .	128	7.6 Electrodes and electrocatalysts . . . . .	242	4.8 Power output, losses, and efficiency . . . . .	129	7.7 Power output and efficiency of a fuel cell . . . . .	244	4.9 MHD power generation systems . . . . .	133	7.8 Fuel cell batteries and systems . . . . .	247	4.10 Economic aspects and future trends . . . . .	136	7.9 Applications and future trends . . . . .	249	<b>5 THERMOELECTRIC POWER GENERATION</b>		<b>8 PHOTOVOLTAIC POWER GENERATION</b>		5.1 Introduction . . . . .	146	5.2 Thermoelectric effects . . . . .	146	8.1 Introduction . . . . .	259	5.3 Classical thermodynamic analysis of the thermoelectric effects . . . . .	148	8.2 Radiation energy . . . . .	260	5.4 Thermoelectric coefficients in semiconductor theory . . . . .	150	8.3 The photovoltaic effect . . . . .	261	5.5 General equations . . . . .	152	8.4 Different types of photovoltaic cells . . . . .	267	5.6 Thermoelectric devices . . . . .	153	8.5 Collection of solar radiation . . . . .	276	5.7 Different types of thermoelectric generators . . . . .	155	8.6 Cell fabrication . . . . .	278			8.7 Power output, losses, and efficiencies . . . . .	279			8.8 Photovoltaic batteries and systems . . . . .	282			8.9 Economic aspects and future trends . . . . .	283			<b>9 ELECTROHYDRODYNAMIC POWER GENERATION</b>						9.1 Introduction . . . . .	292			9.2 Ion mobility . . . . .	293			9.3 EGD equations . . . . .	295			9.4 EGD devices . . . . .	296			9.5 Different types of EGD power generators . . . . .	299																																																						
4.2 Gas conductivity . . . . .	107	7.1 Introduction . . . . .	222																																																																																																																																																												
4.3 Magnetohydrodynamic equations . . . . .	111	7.2 Thermodynamics of a fuel cell . . . . .	222																																																																																																																																																												
4.4 Operating range of an MHD duct . . . . .	114	7.3 Normal fuel cells and regenerative fuel cells . . . . .	225																																																																																																																																																												
4.5 Different types of MHD generators . . . . .	116	7.4 Performance characteristic $V = f(J)$ . . . . .	226																																																																																																																																																												
4.6 Magnetohydrodynamic materials . . . . .	124	7.5 Different types of fuel cells . . . . .	231																																																																																																																																																												
4.7 Production of magnetic fields . . . . .	128	7.6 Electrodes and electrocatalysts . . . . .	242																																																																																																																																																												
4.8 Power output, losses, and efficiency . . . . .	129	7.7 Power output and efficiency of a fuel cell . . . . .	244																																																																																																																																																												
4.9 MHD power generation systems . . . . .	133	7.8 Fuel cell batteries and systems . . . . .	247																																																																																																																																																												
4.10 Economic aspects and future trends . . . . .	136	7.9 Applications and future trends . . . . .	249																																																																																																																																																												
<b>5 THERMOELECTRIC POWER GENERATION</b>		<b>8 PHOTOVOLTAIC POWER GENERATION</b>																																																																																																																																																													
5.1 Introduction . . . . .	146	5.2 Thermoelectric effects . . . . .	146	8.1 Introduction . . . . .	259	5.3 Classical thermodynamic analysis of the thermoelectric effects . . . . .	148	8.2 Radiation energy . . . . .	260	5.4 Thermoelectric coefficients in semiconductor theory . . . . .	150	8.3 The photovoltaic effect . . . . .	261	5.5 General equations . . . . .	152	8.4 Different types of photovoltaic cells . . . . .	267	5.6 Thermoelectric devices . . . . .	153	8.5 Collection of solar radiation . . . . .	276	5.7 Different types of thermoelectric generators . . . . .	155	8.6 Cell fabrication . . . . .	278			8.7 Power output, losses, and efficiencies . . . . .	279			8.8 Photovoltaic batteries and systems . . . . .	282			8.9 Economic aspects and future trends . . . . .	283			<b>9 ELECTROHYDRODYNAMIC POWER GENERATION</b>						9.1 Introduction . . . . .	292			9.2 Ion mobility . . . . .	293			9.3 EGD equations . . . . .	295			9.4 EGD devices . . . . .	296			9.5 Different types of EGD power generators . . . . .	299																																																																																																
5.2 Thermoelectric effects . . . . .	146	8.1 Introduction . . . . .	259																																																																																																																																																												
5.3 Classical thermodynamic analysis of the thermoelectric effects . . . . .	148	8.2 Radiation energy . . . . .	260																																																																																																																																																												
5.4 Thermoelectric coefficients in semiconductor theory . . . . .	150	8.3 The photovoltaic effect . . . . .	261																																																																																																																																																												
5.5 General equations . . . . .	152	8.4 Different types of photovoltaic cells . . . . .	267																																																																																																																																																												
5.6 Thermoelectric devices . . . . .	153	8.5 Collection of solar radiation . . . . .	276																																																																																																																																																												
5.7 Different types of thermoelectric generators . . . . .	155	8.6 Cell fabrication . . . . .	278																																																																																																																																																												
		8.7 Power output, losses, and efficiencies . . . . .	279																																																																																																																																																												
		8.8 Photovoltaic batteries and systems . . . . .	282																																																																																																																																																												
		8.9 Economic aspects and future trends . . . . .	283																																																																																																																																																												
		<b>9 ELECTROHYDRODYNAMIC POWER GENERATION</b>																																																																																																																																																													
				9.1 Introduction . . . . .	292			9.2 Ion mobility . . . . .	293			9.3 EGD equations . . . . .	295			9.4 EGD devices . . . . .	296			9.5 Different types of EGD power generators . . . . .	299																																																																																																																																										
		9.1 Introduction . . . . .	292																																																																																																																																																												
		9.2 Ion mobility . . . . .	293																																																																																																																																																												
		9.3 EGD equations . . . . .	295																																																																																																																																																												
		9.4 EGD devices . . . . .	296																																																																																																																																																												
		9.5 Different types of EGD power generators . . . . .	299																																																																																																																																																												

9.6	EGD materials . . . . .	308
9.7	Techniques for ion injection . . . . .	310
9.8	Power output, losses, and efficiency . . . . .	313
9.9	EGD generators and systems . . . . .	317
9.10	Applications and future trends . . . . .	319
<b>10 PIEZOELECTRIC POWER GENERATION</b>		
10.1	Introduction . . . . .	327
10.2	Crystallography . . . . .	328
10.3	Piezoelectric theory . . . . .	331
10.4	Polarization theory . . . . .	336
10.5	Piezoelectric resonators and oscillators . . . . .	338
10.6	Piezoelectric generators . . . . .	341
10.7	Piezoelectric materials . . . . .	343
10.8	Power output, losses, and efficiency . . . . .	351
10.9	Bioenergetics . . . . .	353
10.10	Piezoelectric generator systems . . . . .	355
10.11	Research and future trends . . . . .	358
<b>11 FERROELECTRIC POWER GENERATION</b>		
11.1	Introduction . . . . .	366
11.2	Basic dielectric concepts . . . . .	367
11.3	Ferroelectric hysteresis and Curie temperature . . . . .	368
11.4	Time constant . . . . .	372
11.5	Ferroelectric devices . . . . .	372
11.6	Ferroelectric generators . . . . .	375
11.7	Ferroelectric materials . . . . .	380
11.8	Power output, losses, and efficiency . . . . .	386
11.9	Specific power output . . . . .	388
11.10	Ferroelectric crystal growth and ceramic preparation . . . . .	390
11.11	Spontaneous polarization of barium titanate . . . . .	391
11.12	Ferroelectric generator systems . . . . .	392
11.13	Future trends . . . . .	393
<b>12 MISCELLANEOUS METHODS OF POWER GENERATION</b>		
<b>A FERROMAGNETIC POWER GENERATION</b>		
12.1	Ferromagnetic theory . . . . .	401
12.2	Ferromagnetic materials . . . . .	404
12.3	Ferromagnetic generator analysis . . . . .	407
<b>B NERNST POWER GENERATION</b>		
12.4	Nernst and Ottinghausen effects . . . . .	409
12.5	Nernst materials . . . . .	411
12.6	Nernst generator analysis . . . . .	413
<b>C THERMOPHOTOVOLTAIC POWER GENERATION</b>		
12.7	Thermophotovoltaic effect . . . . .	416
12.8	Thermophotovoltaic materials . . . . .	417
12.9	Radiant exchange systems and radiant sources . . . . .	419
12.10	Thermophotovoltaic generator analysis . . . . .	419
<b>D OTHER METHODS OF DIRECT ENERGY CONVERSION</b>		
12.11	Solid state converters . . . . .	423
12.12	Liquid state converters . . . . .	426
12.13	Particle collecting converters . . . . .	428
12.14	Other converters . . . . .	429
<b>Appendix I Physical constants</b> . . . . .		
<b>Appendix II Conversion factors</b> . . . . .		
<b>Index</b> . . . . .
