

CONTENTS

LIST OF SYMBOLS	xv
1. INTRODUCTION	1
1.1. Introduction	1
1.2. The concept of a beam	1
1.3. Some applications of charged-particle beams	4
1.4. Notation and style	9
1.5. Note on background physics	11
2. BEAM OPTICS AND FOCUSING SYSTEMS	13
2.1. Introduction	13
2.2. Systems with axial symmetry	15
2.2.1. Introduction; Busch's theorem	15
2.2.2. The paraxial ray equation	18
2.2.3. The formation of images; magnification	30
2.2.4. Some general properties of lenses	33
2.2.5. Electrostatic lenses	36
2.2.6. Magnetic lenses	42
2.2.7. Aberrations in axially symmetrical lenses	45
2.2.8. Spherical aberration	48
2.2.9. Chromatic aberration	50
2.R.2. Notes and references	51
2.3. Two-dimensional systems	52
2.3.1. Strip beams	52
2.3.2. Strip lenses	53
2.R.3. Notes and references	55
2.4. Systems with two planes of symmetry	55
2.4.1. Introduction	55
2.4.2. Quadrupole lenses	56
2.5. Systems with one plane of symmetry and curved axes	61
2.5.1. Introduction	61
2.5.2. Edge focusing	62
2.5.3. Betatron focusing	63
2.5.4. Systems with dispersion	69
2.R.4-5. Notes and references	73
2.6. Curvilinear strip beams	73
2.7. Accelerator orbit theory	76
2.7.1. Introduction	76
2.7.2. Alternating gradient ('strong') focusing	76
2.7.3. The existence of closed orbits; resonances	80
2.7.4. Momentum compaction and negative mass	84
2.7.5. Non-linear effects	87
2.7.6. Azimuthally varying fixed fields	91
2.7.7. Linear coupling between radial and vertical motion	93
2.7.8. Betatron with azimuthal magnetic field; an example of strong linear coupling	95
2.7.9. Coupling arising from non-linearities; a simple example	97
2.7.10. Trajectories, orbits, and focusing; some general observations	99
2.R.6-7. Notes and references	100

2.8.	Focusing in fields which vary with time	101
2.8.1.	Introduction	101
2.8.2.	Longitudinal focusing and phase stability	102
2.8.3.	Radial and energy excursions of phase oscillations; adiabatic damping	110
2.8.4.	Concluding remarks on phase focusing and review of some implicit assumptions	112
2.8.5.	Transverse focusing in time-varying fields; application to cyclotron	113
2.8.6.	Transverse focusing in linear accelerators	114
2.8.7.	Alternate-phase focusing	116
2.8.8.	Notes and references	116
3.	LAMINAR BEAMS WITH SELF-FIELDS	118
3.1.	Introduction	118
3.2.	Characteristics of various types of flow	120
3.2.1.	Introduction	120
3.2.2.	Cylindrical beam in an infinite magnetic field	120
3.2.3.	The planar diode	125
3.2.4.	Launching a cylindrical beam	129
3.2.5.	Strip beams	132
3.2.6.	Properties of a beam with no externally applied fields	133
3.2.7.	Uniform laminar pinch	138
3.2.8.	Equilibrium of a uniform cylindrical beam in a uniform magnetic field	139
3.2.9.	Practical neutralized beams	145
3.3.	The paraxial equation for beams with space charge in axial magnetic fields	150
3.3.1.	Solid beams	150
3.4.	Some further types of space-charge flow	152
3.4.1.	Hollow and planar Brillouin beams	152
3.4.2.	Elliptical beams and elliptical Brillouin flow	156
3.4.3.	Hollow laminar flows with zero axial velocity	160
3.4.4.	Laminar flow in a betatron focusing field	161
3.4.5.	Electrostatically confined flow	162
3.5.	Space charge in periodic systems	162
3.6.	Hydrodynamic approach to space-charge flow	165
3.R.	Notes and references	170
4.	NON-LAMINAR BEAMS WITHOUT COLLISIONS	172
4.1.	Introduction	172
4.2.	Hamiltonian formalism and Liouville's theorem	172
4.3.	The emittance concept	178
4.3.1.	Definition of emittance; brightness	178
4.3.2.	Phase-amplitude variables and beam matching	183
4.3.3.	The distribution of Kapchinskij and Vladimirkij	189
4.3.4.	Phase-amplitude variables in periodic systems	192

4.3.5.	Linear self-field effects; self-constricted beam	194
4.3.6.	Equation of Kapchinskij and Vladimirkij	195
4.3.7.	Complete paraxial envelope equation in reduced variables	196
4.3.8.	Non-linear optical systems; emittance growth	197
4.3.9.	Systems with non-linear self-field forces	203
4.R.1-3.	Notes and references	203
4.4.	Thermal distributions	204
4.4.1.	Introduction; beams and plasmas	204
4.4.2.	Pressure, temperature, and emittance	207
4.4.3.	Focused beams with finite temperature	210
4.4.4.	Matched beam in a uniform external linear focusing field	211
4.4.5.	Self-focused beams; the Bennett pinch	214
4.4.6.	The planar diode with finite emission velocities	217
4.4.7.	Beam in a general linear external focusing system	219
4.4.8.	Limitations to current density in a beam spot arising from thermal velocities at the source	226
4.4.9.	A general survey of factors which limit spot size	228
4.R.4.	Notes and references	233
4.5.	Ring beams and cylindrical current sheets	234
4.5.1.	Introduction	234
4.5.2.	Ring beam in a betatron field in the absence of walls	235
4.5.3.	Ring beam in a betatron field in the presence of walls; Q-shifts	241
4.5.4.	Cylindrical current sheets	245
4.5.5.	Adiabatic variation of ring beams and cylindrical current sheets; betatron 2:1 condition	249
4.5.6.	Crossed-field flows	252
4.R.5.	Notes and references	253
4.6.	A more general approach; the Vlasov equation	254
4.6.1.	Introduction	254
4.6.2.	The determination of self-consistent equilibria	257
4.6.3.	Relativistic beam of Hammer and Rostoker	258
4.R.6.	Notes and references	264
5.	BEAMS WITH SCATTERING OR DISSIPATION	266
5.1.	Introduction	266
5.2.	Multiple scattering of a beam in a background gas or plasma	267
5.3.	Multiple scattering in the presence of focusing	271
5.4.	Scattering between beam particles in storage rings	274
5.5.	Some properties of a beam with finite temperature	275
5.6.	The Boersch effect	277
5.7.	Electron cooling	281

5.8.	Beams formed from runaway electrons	281
5.9.	Budker's relativistic self-constricted beam	283
5.10.	Radiation effects in electron synchrotrons and storage rings	287
5.11.	Concluding remarks	293
6.	WAVES AND INSTABILITIES IN BEAMS	294
6.1.	Introduction	294
6.2.	Waves in unbounded plasma	295
6.2.1.	Introduction	295
6.2.2.	Waves in cold stationary plasma	296
6.2.3.	Plasma surface waves	303
6.2.4.	Steady-state properties of a drifting plasma in a stationary neutralizing background	304
6.2.5.	Longitudinal waves in a cold drifting plasma	307
6.2.6.	Two or more streaming plasmas	312
6.2.7.	A continuum of plasma streams; Landau damping	316
6.R.2.	Notes and references	320
6.3.	Longitudinal waves in beams of finite cross-section	322
6.3.1.	Introduction	322
6.3.2.	Longitudinal waves in a cylindrical beam surrounded by conducting walls	322
6.3.3.	Cylindrical beam with a close-fitting tube in the presence of ions	328
6.3.4.	Cylindrical systems with arbitrary wall impedance and with positive or negative mass	333
6.3.5.	Note on accelerator notation	339
6.3.6.	Cylindrical systems with continuous velocity distributions and Landau damping	340
6.3.7.	Cylindrical beam weakly coupled to a propagating structure; normal modes	347
6.3.8.	Kinetic power theorem for confined flow	353
6.3.9.	Travelling-wave tube and backward-wave oscillator	358
6.3.10.	Longitudinal beam-plasma interaction	365
6.R.3.	Notes and references	367
6.4.	Transverse waves	368
6.4.1.	Introduction	368
6.4.2.	Filamentary beams, coherent betatron oscillations, and cyclotron waves	370
6.4.3.	Behaviour of filamentary waves in a resistive environment	372
6.4.4.	Transverse instability in accelerators	376
6.4.5.	Transverse interaction between beams and travelling waves; beam 'break-up'	384
6.4.6.	Transverse two-stream instability	384
6.R.4.1-6.	Notes and references	387
6.4.7.	Axially symmetrical transverse waves in a paraxial beam	388
6.4.8.	Surface waves on non-vortical beams	393
6.4.9.	Waves on beams with finite vorticity	395

6.4.10.	Multipolar and higher-order transverse waves	400
6.4.11.	Transverse beam-plasma interaction in an unbounded plasma	401
6.4.12.	Further discussion of beam-plasma interaction	402
6.4.13.	Instabilities arising from shear in laminar beams	405
6.R.4.7-13.	Notes and references	411
6.5.	Dynamic phenomena in bunched beams	411
6.5.1.	Introduction	411
6.5.2.	Wake fields	414
6.5.3.	Rigid-bunch approximation	416
6.5.4.	General treatment of bunched-beam instabilities	417
6.R.5.	Notes and references	420
6.6.	Concluding remarks	421
APPENDICES		
Appendix 1.	Fields seen by a particle in a rotating frame in a uniform magnetic field	423
Appendix 2.	Derivation of the paraxial ray equation from the principle of least action	425
Appendix 3.	Paraxial equation for a strip beam with curvilinear axes	427
Appendix 4.	The effect of non-linearities on the period of a harmonic oscillator	430
Appendix 5.	Coupled-mode theory	432
Appendix 6.	The energy associated with transverse waves on a filamentary beam	434
