CONTENTS

Probabilistic and Dynamic Approaches to the Theory of Stochastic Processes
By I. Oppenheim 1

I. Introduction
II. Probabilistic Preliminaries
III. Master Equations
IV. Langevin Equation

Quantum States and Dissipative Processes
By I. Prigogine 11

I. Introduction
II. Einstein's Theory of Spontaneous Emission in Unstable Particles
III. Mechanisms of Dissipation
IV. Probability Amplitudes and Quantum Time
V. Quantum States of Finite Lifetime
VI. Kinetic Equations: Feynman Diagrams and Correlation Diagrams
VII. Boltzmann Approximation
VIII. Physical Particles and Entropy
IX. Kinetic Equations and Quantum States
X. Conclusions and Perspectives

Relaxed Motion in Irreversible Molecular Statistics
By B. O. Koopman 37

I. The Basic Enigma
II. The Basic Macroscopic Functions
III. The Boundary Forces
IV. The Information Content of Probability Statements
V. Heuristic Introduction to Relaxed Motion
VI. Plan of Explicit Calculation
VII. Solution in a Simplified Case: "Vestiginal Forces"
VIII–IX. Calculation of the Information Integrals
X. The Variational Principle
XI. The Linear Approximation
XII. Generalization

Thermal Fluctuations in Nonlinear Systems
By N. van Kampen 65

I. Introduction: The Linear Case
II. The Nonlinear Problem
III. The Master Equation
IV. Expansion of the Master Equation
V. Additional Remarks
VI. The Microscopic Description
VII. The Microscopic Equations of Motion

Error Bounds and Spectral Densities
By R. G. Gordon 79

I. Introduction
II. Properties of Spectral Densities
III. Error Bounds for Averages of Spectral Densities
A. Error Bounds for the Response to a Damped Harmonic Perturbation
B. Error Bounds for Cumulative Distribution
C. Error Bounds for Second-Order Perturbation Energies
IV. Extrapolation Methods for Spectral Densities
V. Summary and Discussion

A Stochastic Theory of Line Shape
By R. Kubo 101

I. Introduction
II. Random Frequency Modulation
III. Two Simple Examples
a. Two State Jump Modulation
b. Gaussian Modulation
IV. Collapse of an NMR Multiplet
V. Low Field Spin Resonance
VI. Spectrum of Excitations to a Doublet with a Random Modulation
VII. Random Stark Modulation of a Hydrogen Atom
VIII. Line Shape of Mössbauer Spectra
IX. Concluding Remarks

A Stochastic Model for Neutron Scattering by Simple Liquids
By R. C. Desai and S. Yip 129

I. Model Calculations
II. Scattering from H_2 in Liquid Argon

Fluctuations in Autocorrelation Functions in Diffusing Systems
By P. H. Verdier 137

I. Introduction
II. Definitions
III. Method
IV. Results
A. Harmonically Bound Particle
B. Particle in a Box
C. Plane Rotor
D. Spherical Rotor
V. Relaxation Times
VI. Discussion

Stochastic Theory of Chemical Rate Processes
By D. A. McQuarrie 149

I. Introduction
II. Random Walk Model of Unimolecular Decomposition
III. Exactly Solvable Elementary Reactions
IV. Selected Applications
A. Kinetics of Reactant Isolation
B. Reaction Kinetics on Linear Lattices with Neighbor Effects
C. Kinetics of Photochemical Reactions in Nucleic Acid Derivatives
D. Nucleation Theory

The Kinetics of Biopolymerization on Nucleic Acid Templates
By J. H. Gibbs 185

I. Introduction
II. DNA Replication
III. Protein Synthesis

Some Models for the Decay of Initial Correlations in Dynamical Systems
By G. H. Weiss 199

I. Introduction
II. The Independent Random Walk Model
III. Harmonic Oscillator Models
IV. The One-Dimensional Ising Model

Vibrational Relaxation of a Gas of Diatomic Molecules
By T. A. Bak and P. G. Sørensen 219

I. Introduction
II. The Master Equation
III. The Linear Equation
IV Qualitative Features of the Linear Equation
V. The Monte Carlo Process
VI. Discussion

Self-Avoiding Walks on Lattices
By C. Domb **229**

I. Introduction
II. Random Walks, Restricted Walks, and Self-Avoiding Walks
III. Methods of Investigating Self-Avoiding Walks
  A. Rigorous Analysis
  B. Monte Carlo
  C. Exact Enumeration
  D. Transition Matrix
IV. Properties of Self-Avoiding Walks
  A. Number of Walks of *n* Steps
  B. Number of Polygonal Closures of *n* Steps
  C. Mean Square Length
  D. Probability Distribution of End Points
  E. Mean Square Radius of Gyration
  F. Correlation Between Steps
  G. Passage from a Restricted to a Self-Avoiding Walk
V. Analogy with the Ising Model
VI. Continuum Models
VII. Conclusions

Non-Self Intersecting Random Walks on Lattices with Near-Neighbor Interactions
By J. Mazur **261**

I. Introduction
II. Thermodynamic Properties of Self-Interacting Chains from the Monte Carlo Computations
III. Stochastic Model for Restricted Self-Avoiding Chains with Nearest-Neighbor Interactions
  A. General Considerations
  B. Derivation of the Chain Partition Function
IV. Preliminary Results

Reversible Kinetics on Linear Lattices with Neighbor Effects
By P. Rabinowitz, A. Silberberg, R. Simha and E. Loftus . . **281**

I. General Considerations
II. Derivation of Kinetics
III. Equilibrium Relations
IV. Numerical Approximations
V. Some Applications

Stochastic Models for Chain Dynamics
By R. A. Orwoll and W. H. Stockmayer 305

I. Introduction
II. Freely Jointed Chain
III. One-Dimensional Chain with Correlations
IV. Discussion

Langevin Theory of Polymer Dynamics in Dilute Solution
By R. Zwanzig 325

I. Introduction
II. Hydrodynamic Interaction
III. Fokker-Planck Equation
IV. Langevin Equation

Toeplitz Determinants: Some Applications, Theorems and Conjectures
By M. E. Fisher and R. E. Hartwig 333

I. Introduction and Examples
  A. Random Walk
  B. Prediction Theory
  C. Ising Model Correlation Functions
  D. Dimers on a Plane Lattice
II. Previous Results
III. Extensions of the Classical Theorem
IV. Special Results and Conjectures
V. Summary

A New Series Expansion for Path Integrals in Statistical Mechanics
By T. Burke and A. Siegel. 355

Brownian Motion and Indeterminacy Relations
By E. Guth 363

I. Introduction
II. The Burgers Equation Approach
III. The Kramers Equation Approach
