QUANTUM THEORIES OF CHEMICAL KINETICS

JOHN C. LIGHT

*James Franck Institute and the Department of Chemistry
The University of Chicago, Chicago, Illinois*

CONTENTS

I. Introduction	1
II. Model Potentials and Perturbation Theory	4
A. Perturbation Theory	6
B. Model Potentials	7
III. Numerical Calculations for Collinear Collisions	8
A. Finite Difference Methods	9
B. Reaction Coordinates and Coupled Channel Calculations	11
C. Quantum Tunneling in Reactive Collisions	23
IV. Alternative Approaches	25
References	30

A REVIEW OF ION-MOLECULE REACTIONS*

LEWIS FRIEDMAN AND BRYAN G. REUBEN†

*Department of Chemistry, Brookhaven National Laboratory, Upton,
New York*

CONTENTS

I. Introduction	35
II. Historical Background	37
A. The Single Source Technique	37
B. Further Development of the Single Source	41
C. The Development of the Tandem Mass Spectrometer	46
1. Lindholm	46
2. Cermak and Herman	51
3. Giese and Maier	52
III. Thermochemistry of Ions	56
A. Introduction	56
B. Ionization and Appearance Potentials	57
C. Kinetic Approach to Thermochemistry	59
1. Proton Affinity of Hydrogen	59
2. Proton Affinity of Water	64
3. Proton Affinity of Ammonia	67
4. Proton Affinities of Other Molecules	68
5. Threshold for the Reaction $C^+ + D_2 \rightarrow CD^+ + D$	69
6. N_3^+ , C_2O^+ , O_3^+	70
7. Attenuation Data and the Identification of Excited States in Beams	71
D. Equilibrium Approach to Ion Thermochemistry	73
E. Discussion	80
IV. Kinetics of Ion-Molecule Reactions	82
A. Introduction	82
B. Complex Formation versus Stripping	83
1. Stripping Mechanisms	83
2. Development of Angular and Velocity Distribution Measurements	85
3. Ion Intensity Maps	86
4. Crossed Beam Experiments	89
5. Evidence for Complex Formation	90

* Work supported by the U.S. Atomic Energy Commission.

† On leave from: Department of Chemistry, University of Surrey, Guildford, Surrey, England.

6. Transition from Stripping to Complex Formation	92
7. Discussion	95
C. Isotope Effects	97
1. Simple Systems	97
2. Complex Systems	99
D. Long-Lived Collision Complexes	102
1. Introduction	102
2. Polymerization Reactions	103
3. Addition Reactions	105
4. Clustering Reactions	109
5. Determination of Rate Constants in High Pressure Systems	109
E. State Selection of Reactants	111
1. Introduction	111
2. Pulsed Source Techniques	112
3. Flowing Afterglow	114
4. Photoionization	118
F. Channels of Reaction	123
1. Introduction	123
2. Single Source and Tandem Mass Spectrometer Techniques	123
3. High Pressure Mass Spectrometry	125
4. Ion Cyclotron Resonance Spectroscopy	126
5. "Exotic" Channels of Reaction	129
References	132

ION CYCLOTRON RESONANCE

GEORGE A. GRAY

Oregon Graduate Center for Study and Research, Portland, Oregon

CONTENTS

I. Introduction	141
II. Experimental	143
A. Single and Double Resonance	143
B. Pulse Experiments	147
C. Scattering Experiments	151
D. Transient ICR	152
III. Collision-broadened ICR	153
IV. Energy Dependence of Ion Molecule Reactions	157
A. Bimolecular Rate Constants	157
B. Interaction Potential	159
V. ICR of Small Molecules	161
VI. Systems of Chemical Interest	171
A. Rate Constants	171
B. Methane-Hydrogen	172
C. Olefins	177
D. Reactions of Hydrocarbon Derivatives	182
E. Thermochemical Considerations	191
F. Applications of ICR to Ionic Structure	195
VII. Conclusion	203
References	204

STABILITY AND DISSIPATIVE STRUCTURES IN OPEN SYSTEMS FAR FROM EQUILIBRIUM

G. NICOLIS,

Faculté des Sciences de l'Université Libre de Bruxelles, Belgium

CONTENTS

I. Introduction	210
II. Thermodynamics of Irreversible Processes	211
A. General Theory and the Linear Region	211
B. Nonlinear Thermodynamics	217
III. Open Systems at Mechanical Equilibrium	220
A. General Comments	220
B. Evolution Criterion	221
C. Stability Theory	224
D. Stability Theory and Irreversible Thermodynamics	228
E. Dissipative Structures	234
IV. Chemical Oscillations—General Theory and Conservative Systems	237
A. Introduction	237
B. Two Independent Variables—Singular Points and Variational Equations	239
C. Thermodynamic Interpretation	244
D. The Volterra–Lotka Model	247
E. Thermodynamic Properties of the Volterra–Lotka System	252
V. Limit Cycles	255
A. Introduction	255
B. Chemical Instabilities—A Simple Example	258
C. Thermodynamic Analysis of Limit Cycles	265
D. Temporal Organization Beyond Instability—Comparison with the Volterra–Lotka Model	269
E. Experimental Evidence and Further Examples of Chemical Instabilities	275
VI. Symmetry-breaking Instabilities	277
A. General Comments	277
B. Examples of Symmetry-breaking Instabilities	278
C. Dissipative Structures Beyond Symmetry-breaking Instabilities	283
D. Stability of time-dependent States and Interference Effects	284
VII. Multistationary States	287
A. Introduction	287

B. Examples of Multiple Steady States	288
C. Thermodynamic Properties	294
VIII. Fluctuations	295
A. Introduction	295
B. The Markovian Stochastic Approximation	296
C. Fluctuations Around Nonequilibrium States—General Ideas and a Simple Application	298
D. Evolution of Large Fluctuations—The Volterra–Lotka Model	305
IX. Applications in Biology	314
A. Introduction	314
B. Oscillatory Processes in Biology	315
C. Symmetry-breaking Instabilities and Interference Effects	317
D. Multiple steady States.	318
X. General Conclusions	319
Acknowledgments	321
References	321

**STATISTICAL—MECHANICAL THEORIES
IN BIOLOGY**

EDWARD H. KERNER

Physics Department, University of Delaware, Newark, Delaware

CONTENTS

I. Introduction	325
II. Generalities on Ensembles	328
III. Ecodynamics	333
IV. Neural Networks	339
V. Biochemical Kinetics	342
VI. Mathematical Overview	346
References	351
