SURFACE AND BULK SPECTROSCOPY OF A MOLECULAR CRYSTAL: EFFECT OF RELAXATION AND THERMAL OR STATIC DISORDER

MICHEL ORRIT AND PHILÉMON KOTTIS

Centre de Physique Moléculaire Optique et Hertzienne
Université de Bordeaux I
Talence, France

CONTENTS

Introduction
I. Dipolar Excitons
  A. Electromagnetic Interactions in an Assembly of *N* Dipoles
    1. The Electric-Dipole Interaction
      a. The Quasi-boson Approximation
      b. Interactions in the Coulomb Gauge
      c. Interactions in the Electric-Dipole Gauge
    2. Elementary Excitations of the Coupled System
    3. Eigenfrequency Equation and Elementary Excitations of the Matter–Radiation System
    4. Radiated Fields in the Semiclassical Theory
  B. The Crystal of Dipoles
    1. Dipole Sums
    2. The Method of Ewald
    3. Excitons and Polaritons
      a. Coulombic Interactions: The Molecular-Crystal Exciton
      b. Retarded Interactions: The Molecular-Crystal Polariton
  C. Influence of the Extended Molecular Electronic Cloud
    1. Lattice of Realistic Molecules
    2. The Anthracene Crystal Lattice
  D. Concluding Remarks
II. Coupling of the Bulk Excitons to the Molecular Vibrations and to the Lattice Phonons
  A. Mechanisms of Coupling to the Vibrations
    1. Phonons and Vibrations
    2. Coupling to the Electronic Excitations

a. The Intramolecular Coupling
b. The Coupling to Phonons
c. Exciton–Photon–Phonon Coupling
3. General Aspects of the Exciton–Vibration Coupling

B. The Vibronic Coupling
1. The Vibron Model
a. Molecular Vibronic States
b. The Vibronic Exciton
c. Collective Couplings
2. Inclusion of Two-Particle Mechanisms
a. The Two-Particle-State Continuum
b. The Rashba Hamiltonian
c. Exact Derivation of the Optical Absorption
d. Discussion of the Results
3. Vibronic Absorption Structures of the Anthracene Crystal
a. Vibronic Reflectivity Spectra
b. Positions and Intensities of the Vibronic Lines

C. Optical Absorption in the Field of Phonons
1. Theoretical Models of Optical Absorption
a. Weak Exciton–Phonon Coupling
b. Strong Exciton–Phonon Coupling
2. Absorption Spectra as Kramers–Kronig-Transformed Reflection Spectra
a. The Ideal Crystal in Its Phonon Bath
b. The Real Crystal
c. Two Candidates for KK Analysis
d. Phonon Broadening of the 0–0 Transition
e. The Principle of the KK Transformation
f. The Application of the KK Transformation to the UV Domain
3. Theory and Discussion
a. Contribution of Acoustical and Optical Phonons
b. Discussion of the Theoretical Approach

D. The Finite-Crystal Secondary Emissions
1. General Aspects of the Crystal Secondary Emissions
2. The Raman Scattering of the Anthracene Crystal
3. Intrinsic Fluorescence of the Anthracene Crystal
a. The Experimental Observations
b. Model Relaxation Mechanisms for the Decay of Polaritons
c. Interpretation of the Fluorescence Spectra

III. Surface-Exciton Photodynamics and Intrinsic Relaxation Mechanisms

A. The Optical Response of the Surface Exciton
1. Experimental Observations
a. The Reflectivity of the Crystal Surface
b. Excitation Spectra of the Surface Fluorescence
2. A Layer of Dipoles Coupled to the Radiation Field
a. Coulombic Dispersion of the 2D Exciton
b. Effect of Retarded Interactions
c. The Exact Solution: The 2D Polariton and the Temporal Description
3. The Influence of the Substrate
a. Coupling of Surface to Bulk via Radiation
b. The First-Surface Reflectivity Signature

c. Combined Interface Effects on the Surface Excitons
d. The Signatures of Subsurfaces II and III
4. Origins of Broadening of the Surface Exciton: Intrinsic Broadening

B. Mechanisms of Intrasurface Relaxation
1. Excitation Spectra of the Surface Emission
a. Experimental Procedure
b. Theoretical Description
2. The Vibronic Excited States of the Surface
a. The Second Davydov Component of the Surface Exciton
b. The Vibronic 390- and 1400-cm^{-1} Surface States
c. A Monolayer Surface Phonon
3. Relaxation Mechanisms

C. Reconstruction of the Crystal Surface
1. The Ground-State Surface
a. General Considerations
b. A Simple Model of Surface Reconstruction
c. Surface Variation of the 49-cm^{-1} Phonon
2. The Surface Excitons
a. Possible Origins of Destabilization
b. Spatial Dependence of the Destabilization
c. Surface Excitonic Dispersion
3. Surface Reconstruction or No Surface Reconstruction

D. Conclusion

IV. Specific Properties of Disordered 2D Excitons

A. A Transition to Coherence in the Spontaneous Emission of 2D Disordered Excitons
1. Experimental Observations
2. Model of 2D Disordered Excitons
3. A Simple Model
4. Optical Response and Emission from a 2D Disordered Lattice
a. Optical Response
b. Relaxed Emission

B. Disordered 2D Coulombic Excitons
1. The Model of the Binary Alloy
2. The Virtual Crystal
3. Dilute Impurities
a. The Isolated Impurity
b. Expansion in t Matrices
4. Self-Consistent Mean Field (CPA)

C. Nonlocal Approximations for the Naphthalene Triplet Excitations
1. The Triplet Exciton in an Isotopically Mixed Crystal
a. Band Structure of the Triplet Exciton
b. The Pure Crystal
c. Expansion in a Basis of Aggregates
2. Numerical Simulations of Disordered Triplet Excitons
a. Density of States
b. Absorption Spectra
3. Nonlocal Extensions of the CPA
a. Limitations of the CPA
b. New Difficulties Connected with the Microscopic Environment of the Site

c. The Limits of the Molecular CPA (MCPA)
4. Percolation and HCPA
a. Percolation of Bonds and Sites
b. Pure Nondiagonal Disorder and HCPA
c. Pure Diagonal Disorder
5. One-Cell Scattering in an Effective Medium
a. Mean Scattering
b. The Choice of the Effective Medium
c. Discussion of the Results
d. Concluding Remark

D. Polaritons in 3D Mixed Crystals
1. General Aspects
2. Disorder Effects on 3D Retarded Interactions
3. A Few Simple Approximations
a. The Virtual Crystal
b. Local Impurity
c. ATA and CPA
d. Approximation of the Average Polarizability
4. Concluding Remarks on the 3D Disordered Lattice

APPENDIXES

A. The Linear Response
1. The General Formalism
2. The Optical Absorption

B. The Resolvent
1. Elimination of Certain Degrees of Freedom
2. A Perturbation Acting inside One Subspace

C. Unitary Transformation

INTERMOLECULAR AND INTRAMOLECULAR POTENTIALS

Topographical Aspects, Calculation, and Functional Representation via a Double Many-Body Expansion Method

A. J. C. VARANDAS

Departamento de Quimica, Universidade de Coimbra, Coimbra, Portugal

CONTENTS

I. Introduction

II. General Principles
- A. The Concept of Molecular Potential
- B. Coordinates and Potential Representation
- C. Topographical Features

III. Calculation of the Potential Energy by ab initio Methods: A Survey of the Theory
- A. Judicious Synthesis of Theory and Experiment
- B. The Perturbational Method
- C. The Variational Method

IV. Semiempirical Calculation and Functional Representation of the Potential Energy
- A. Local versus Global Representations
- B. The MBE Method
  1. The MBE Method for s^3 Systems
- C. The DMBE Method
- D. The Functional Form of the n-Body Energy Terms
  1. The EHFACE 2 Model
  2. The EHFACE 3 Model

V. EHFACE Potentials for van der Waals Molecules and Other More Stable Systems
- A. Diatomic Systems
- B. Triatomic Systems
  1. van der Waals Molecules
  2. More Stable Molecules
  3. H_3: A Well-Studied Jahn–Teller System

VI. Concluding Remarks

Appendix: Update 1987
