# HARD CONVEX BODY FLUIDS

M. P. ALLEN

*H. H. Wills Physics Laboratory,  
Tyndall Avenue Bristol BS8 1TL, UK*

G. T. EVANS

*Department of Chemistry, Oregon State University,  
Corvallis OR 97331 USA*

D. FRENKEL, B. M. MULDER

*F.O.M. Institute for Atomic and Molecular Physics,  
Kruislaan 407, 1098 SJ Amsterdam, The Netherlands*

## CONTENTS

### I. Introduction

#### A. Simulations

##### 1. Simulation Strategies

#### B. Hard Particles

#### C. Simulation Methods

#### D. Theories

## PART 1: THE ISOTROPIC PHASE

### II. Static Properties

#### A. Static Properties in the Isotropic Phase

#### B. Theory

##### 1. The System

#### C. Thermodynamic Properties

##### 1. Relationship of Pair Correlation Functions to Thermodynamic Properties

##### 2. Scalar Properties

###### a. Virial Coefficients

###### b. Equations of State

- 3. Vector Properties
  - a. Virial Coefficients
  - b. Contact Orientational Correlations
- 4. Integral Equation Methods
- D. Simulations
  - 1. Overlap Criteria
    - a. Spheres and Composite Particles
    - b. Spherocylinders
    - c. Platelets
    - d. Truncated Spheres
    - e. Ellipsoids
    - f. Parallel Hard Particles
    - g. Other Shapes
  - 2. Virial Coefficients
  - 3. Equation of State
  - 4. Some Results
    - a. Virial Coefficients of Spherocylinders
- E. Structure
  - 1. Surface-Surface Distance for Ellipsoids

### III. Dynamical Properties

- A. Transport Phenomena in Isotropic Phases
- B. Time Evolution Operators
- C. Time Correlation Functions
  - 1. Single Particle Properties
  - 2. Collective Properties
  - 3. Positional and Orientational Properties
  - 4. Collision Integrals
- D. Applications of Enskog Theory
  - 1. Pure Fluids of HCBs
  - 2. Infinitely Dilute Solution
- E. Simulations
  - 1. Translational and Rotational Diffusion
  - 2. Pretransitional Collective Rotation

## PART 2: THE LIQUID-CRYSTALLINE PHASE

### IV. Phase Transitions

- A. Theory
  - 1. Density Functional Formalism
  - 2. Specific Approximations
    - a. The Onsager Approximation
    - b. Scaled Particle Theory
    - c. Direct Correlation Function Approaches
    - d. Weighted Density Approximations
    - e. Empirical Approaches
  - 3. Specific Transitions
    - a. Isotropic-Nematic Transition
    - b. Nematic-Smectic Transition
    - c. Mixtures
    - d. Two-Dimensional Nematics

4. Critical Discussion

B. Simulations

1. Phase Transitions and Free Energy

a. The Natural Way

b. Artificial Reversible Paths

2. Phase Transitions in Liquid Crystals

a. Particle Insertion Method

b. Free Energies of Smectic and Columnar Phases

c. Alternatives to Free Energy Calculations

3. Results: Spheroids

4. Beyond Nematics

a. Parallel Molecules

b. The Effect of Rotation

c. Columnar Phases

5. Simulation of 2D Nematics

V. Static Properties

A. Theory

1. Order Parameters

2. Correlation Functions

3. Equation of State

4. Frank Elastic Constants

B. Simulations

1. Orientational Order Parameters

a. Translational Correlation Functions

2. Correlation Functions

3. Frank Elastic Constants

VI. Dynamic Properties

VII. Outlook

Acknowledgments

Appendices to Part 1

A. The Ideal Free Energy of Rigid Bodies

B. Center-to-Center Vectors

C. Support Functions

D. Jacobians

Appendices to Part 2

A.1. Free Energy of Molecular Crystals

A.2. System-Size Dependence of Nematic Order Parameter

## CONTENTS

### Glossary of Most Often Used Abbreviations

### Molecules Discussed in the Text

- I. Introduction
  - A. General
  - B. Electronic States of an Isolated Charge Transfer Complex
  - C. Optical Spectra of Isolated CT Complexes
  - D. Charge Transfer Crystals
  - E. Excitons in CT Crystals
- II. Charge Transfer Character of Triplet Excitons
  - A. General
  - B. CT Character and the Optical Spectra of the Triplet State
    - 1. Singlet-Triplet Energy Separation
    - 2. Exciton-Phonon Coupling
  - C. CT Character and Paramagnetic Properties of the Triplet State
    - 1. Zero Field and High Field Splitting of Triplet Sublevels
    - 2. Experimental Approaches
    - 3. Zero Field Splitting and the CT Character of the Triplet State
    - 4. Fine Structure of Mobile Excitons in CT Crystals
- III. Triple Exciton Dynamics
  - A. General
  - B. Averaging of Hyperfine Structure in ESR Spectra

\* Present address: Department of Chemistry, University of Washington, Seattle WA 98105 USA.

- C. Averaging of Fine Structure Tensors
- D. Coherence Versus Incoherence
- E. Interaction of Mobile Excitons with Nuclear Spins
  - 1. Optical Nuclear Polarization
  - 2. Triple Exciton Dynamics via Nuclear Relaxation Mechanism
- F. Interaction with Doublet States
- IV. Kinetics of Triplet Excitons in CT Crystals
  - A. General
  - B. Kinetics of Isolated Triplet States
    - 1. Triplet Sublevel Population Rates
    - 2. Triplet State Depopulation Processes
  - C. Kinetics of Mobile Triplet Excitons
    - 1. Resonant Band Phosphorescence
    - 2. Trapping
    - 3. Triplet-Triplet Exciton Annihilation: Optical Studies
    - 4. Mechanisms of Triplet-Triplet Annihilation: ODMR Studies
    - 5. Triplet-Triplet Annihilation and Photoelectric Properties
  - D. Kinetic Schemes in Various CT Crystals: Summary
- V. Triplet Excitons as Probes of the Molecular Dynamics
  - A. General
  - B. Effects of Molecular Dynamics on Excitonic ESR Lineshape and Linewidth
    - 1. A/TCNB Crystal
    - 2. N/TCNB Crystal
  - C. Influence of Molecular Dynamics on zfs Tensors
  - D. Corroboration by Other Experimental Techniques
    - 1. X-Ray and Neutron Diffraction Analysis
    - 2. Nuclear Magnetic Resonance
    - 3. Raman Scattering
    - 4. Calorimetry
- VI. Triplet Trap States in CT Crystals
  - A. General
  - B. Defects in 1:1 Crystals
    - 1. Optical Emission Studies
    - 2. ODMR and ESR Studies
    - 3. ENDOR Studies
    - 4. The Nature of Defects
  - C. Defects Created by Doping
    - 1. CT Character of Dopant Complexes
    - 2. Dopant Complexes as Probes of Molecular Dynamics

## **CONTENTS**

- I. The Status of the Leslie-Ericksen Theory
  - A. The Equations of LE Theory
  - B. Shear Flow Predictions: Flow-Aligning and Tumbling
  - C. Peculiar Scaling Properties
  - D. Linearity Versus Nonlinearity
  - E. Frank Elasticity and Defects
- II. The Rod-Like Molecular Model
  - A. The Equation for the Orientational Distribution
  - B. From the Distribution to the Stress Tensor
  - C. Nematic Mean-Field Potential
  - D. Slow Flow Results
  - E. Nonlinear Behavior of Flowing LCPs
    - 1. Dynamic Transition from Tumbling to Flow Alignment
    - 2. The Negative Normal Stress Effect
    - 3. The Full Three-Dimensional Results
    - 4. Approximations and Constitutive Equations
  - F. The Linear Limit Revisited: The Puzzle of the Shear Viscosity
- III. The Polydomain Problem
  - A. Simple Polydomain Models of LCP Rheology
  - B. Scaling Laws for LCPs: The Larson-Doi Constitutive Equation
  - C. A Closer Look into Tumbling and Defects
  - D. Defect Cores
  - E. Role of Defect Cores in the Dynamics of Tumbling Nematics
  - F. Scaling Arguments Based on Defect Cores
- IV. Summary and Conclusions
- Acknowledgments
- Appendix A
- References
