

The Method of the Correlation Function in Superconductivity Theory

G. LÜDERS and K.-D. USADEL

Contents

Frequently Used Symbols	4
Introduction	6
I. General Theory	10
1. Survey of Microscopic Superconductivity Theory	10
a) Cooperative Pairing	10
b) Gorkov's Equations	12
2. Thermodynamics. Second Kind Transitions	17
a) Phenomenological Thermodynamics	17
b) Statistical Thermodynamics	18
c) Second Kind Transitions	20
3. General Properties of the Kernel. Density of States	23
a) General Properties of $K_\omega(\mathbf{r}, \mathbf{r}')$	23
b) Density of States	25
c) Remark on Strong-Coupling Superconductors	27
4. Calculation of the Kernel from Classical Mechanics	28
a) Quantum-Mechanical and Classical Correlation Function	28
b) General Properties of the Kernel Confirmed	31
c) Distribution Function in Phase Space	32
d) Electrons in a Crystal	33
5. Boltzmann Equation	37
a) General Formulations	37
b) Restrictions on Scattering Probability and Cross Sections. General Properties of the Kernel Confirmed	41
6. Boundary Conditions	44
a) Surfaces	44
b) Interfaces	47
7. Proofs for Free Electrons	49
a) No Impurities Present	50
b) Impurity Averaged Green's Function	54
c) Impurity Averaged Kernel	59
d) Boundary Conditions for Specular Reflexion	61
8. Proofs for Electrons in a Periodic Potential	63
a) General Formulations	63
b) Magnetic Field and Impurities Absent	65
c) Quasi-Classical Approximation	69
d) Impurity Scattering	73

9. Paramagnetic Impurities	78
a) Warning	78
b) Derivation of the Boltzmann Equation	79
II. General Discussion. Approximation Methods	84
10. Survey of Chapter I	84
a) Gap Equation	84
b) Boltzmann Equation	85
c) Boundary Conditions	88
11. Uniqueness, Positiveness, and Boundedness of the Kernel. Transition Temperature	90
a) Uniqueness	90
b) Positiveness and Boundedness	93
c) Transition Temperature of a Single Metal	95
12. Classical Orbits	99
a) Clean Metal	99
b) Metal with Impurities	102
13. Ginzburg-Landau Approximation	104
a) Derivation of the Linearized Ginzburg-Landau Equation for Clean Metals	105
b) Derivation of the Linearized Ginzburg-Landau Equation for Metals Containing Impurities	107
c) Generalized Ginzburg-Landau Equation	110
14. Diffusion Approximation	114
a) Derivation and Discussion of the Diffusion Equation	114
b) General Properties of the Kernel	117
c) Ginzburg-Landau-like Formulation	118
d) Elimination of the Cut-Off	123
15. Ginzburg-Landau Approximation: Boundary Conditions	125
a) Surfaces, Lowest Order	126
b) Surfaces, Higher Orders (for Clean Metals only)	129
c) Interfaces (for Clean Metals only)	135
d) A Variational Principle	139
16. Diffusion Approximation: Boundary Conditions	141
a) Variational Principle	142
b) Boundary Conditions	145
17. Single Homogeneous Metal with Isotropic Impurity Scattering	149
a) General Formulations	149
b) Approximations	150
c) Perturbation Treatment	153
18. Electric Current Density	159
a) General Formulations	159
b) Approximations	161
III. Applications	165
19. The Bulk Critical Field H_{c2}	165
a) Ginzburg-Landau and Diffusion Approximation	165
b) A General Theorem	167
c) Special Examples	170
20. The Surface Normal Critical Field $H_{c\perp}$	175
a) Ginzburg-Landau and Diffusion Approximation	175
b) General Theorems	176
c) Going beyond the Approximations	177

21.	The Surface Parallel Critical Field H_{c3}	182
a)	Ginzburg-Landau and Diffusion Approximation	183
b)	Going beyond the Approximations	184
c)	General Theorems Concerning the Electric Current Density	191
22.	The Surface Parallel Critical Field, $H_{c }$, of Layers	194
a)	Ginzburg-Landau and Diffusion Approximation	195
b)	Going beyond the Approximations	198
c)	Thin Films	202
23.	Several Metals in Electric Contact	208
a)	General Remarks	208
b)	Cooper Limit	209
