Theory of Van der Waals Attraction

DIETER LANGBEIN

Contents

1. Introduction 2
1.1. Fields of Application 2
1.2. Intermolecular Potentials 4
1.3. Theoretical Approaches 8
1.4. Schematic Classification 10

2. Pair Interactions 12
2.1. Susceptibility 12
2.2. Interaction Energy 13
2.3. Electric Dipoles 15
2.4. Spheres 16
2.5. Small Separations 19
2.6. Large Separations 21
2.7. Asymptotic Power Laws 24
2.8. Cylinders, Small Separations 25

3. Multiplet Interactions 27
3.1. Fluctuations 27
3.2. Multiplet Interactions 30
3.3. Harmonic Oscillators 32
3.4. State Density Integration 36
3.5. Screened Interaction Fields 38
3.6. Energy Dissipation 40

4. Macroscopic Particles 46
4.1. Homogeneous Isotropic Particles 46
4.2. Spheres, Microscopic Approach 50
4.3. Spheres, Macroscopic Approach 53
4.4. Cylinders 56
4.5. Half-Spaces 59
4.6. Small Separations 61
4.7. Multilayers 65
4.8. Continuous Permeability 69

5. Retardation 72
5.1. Radiation 72
5.2. Transverse Modes 74
5.3. Multipole Susceptibilities 76
5.4. Transposition 78
5.5. Pair States 80
5.6. Spherical Addition Theorems 82

6. Retarded Dispersion Energy 86
6.1. Spheres 86
6.2. Cylinders 89
6.3. Half-Spaces 92
6.4. Summary 93
6.5. Lattices 96

7. Schrödinger Formalism 99
7.1. Perturbation Theory 99
7.2. Reaction Potentials 103
7.3. Multipole Susceptibilities 105
7.4. Retardation 108
7.5. Spherical Particles 110
7.6. Integrals of Legendre Functions 114

8. Electrons and Photons 117
8.1. Second Quantization 117
8.2. Fourth Order Perturbation Theory 119
8.3. Zero Temperature Limit 123
8.4. Quasi-Particles 125
8.5. Gibbs Distribution 129
8.6. Free Energy of Attraction 131

Bibliography 134
