

Contents

1. Introduction	1
2. Monocrystalline Filaments (Whiskers)	4
2.1 Crystal Growth	4
2.2 Handling	4
2.3 Characteristic Properties	5
3. Low Temperature Techniques	9
3.1 General Features	9
3.2 ^4He Bath Cryostat (1.4 K - 4.2 K)	10
3.3 ^4He Overpressure Cryostat (3.0 K - 7.5 K)	10
3.4 ^3He Cryostat with Superfluid ^4He Bath (0.45 K - 1.4 K)	12
4. Basic Experimental Observations	14
5. Overview of Theories	17
5.1 Ginsburg-Landau Theory	18
5.2 BCS Ground State and Quasiparticle Excitations	21
5.3 Charge Imbalance and Quasiparticle/Pair Electrochemical Potentials	25
5.4 Relaxation of Charge Imbalance	34
5.5 Energy Mode	46
5.6 Collective Excitations	51
5.7 Dynamics of Charge Imbalance	54
5.8 Models for a Phase-Slip Center	59
5.8.1 The Phase-Slip Phenomenon	59
5.8.2 The RSM Model	62
5.8.3 The SBT Model	63
5.8.4 The KSS Model	69
5.9 Time-Dependent Ginsburg-Landau (TDGL) Theory	79
5.10 Final and Summarizing Remarks	95

6. Equilibrium Properties	99
6.1 Critical Current	99
6.2 Critical Temperature	103
7. Fundamental Properties of Phase-Slip Centers	107
7.1 Introductory Remarks	107
7.2 Quasiparticle Diffusion Length and Time Averaged Supercurrent	108
7.3 The Influence of High-Frequency Radiation	123
7.4 Localization of Phase-Slip Centers	138
7.5 Stabilization of Superconductivity by a Phase-Slip Center	142
7.6 Electrochemical Potentials of Pairs and Quasi- particles - Evidence for Collective Excitations	155
8. The Limit of Long Quasiparticle Relaxation Times	168
8.1 Introductory Remarks	168
8.2 Experiments on Zn and <u>Zn</u> -Ag Whiskers	169
8.3 Interpretation by Comparison with Theoretical Work	173
9. The Limit of Short Quasiparticle Relaxation Times	178
9.1 Introductory Remarks	178
9.2 Change from Weak to Strong Coupling Behaviour: Experiments on Whiskers of the In-Pb Alloy System	179
9.2.1 In-Rich Alloys	179
9.2.2 The Range of Substantial Alloy Contents	182
9.2.3 Pure Pb	183
9.2.4 Pb with Small Impurity Concentrations of In (or Bi)	188
9.3 Interpretation within Phase-Slip Models and the TDGL Theory	189
10. Universal Behaviour of an Isolated Phase-Slip Center: Experiment and TDGL Theory	198
11. Hysteresis of the Critical Current	211
11.1 Introductory Remarks	211
11.2 Heat Transfer from a Metallic Filament into Helium - The Kapitza Resistance	216
11.3 Hysteretic Behaviour of a Tin Whisker	222

11.4	Phenomenological Hysteresis Model	224
11.4.1	A Model with Two Fitting Parameters	224
11.4.2	Comparison with Experiment	230
11.4.3	A Model without Fitting Parameters	235
11.4.4	Comparison with Experiment	238
11.5	The Hysteresis in the TDGL Theory	241
12.	Tunable Weak Links	245
12.1	Experiments	246
12.2	Interpretation	251
13.	Remarks on Ongoing Work	256
13.1	Low-Temperature Behaviour of a Phase-Slip Center	256
13.2	Tunable Weak Links	258
13.3	Microcontacts	266
13.4	The Interaction of Phase-Slip Centers in Zn Whiskers	269
14.	Conclusions	283
A.	Appendix	287
A.1	Different Definitions of the Charge Imbalance	287
A.2	Remarks on the Calculation of the Quasiparticle Chemical Potential	288
A.3	Inelastic Electron-Phonon Scattering Time	288
A.4	Remarks on the Derivation of the Charge Imbalance Wave Equation	295
A.5	Remarks on the Calculation of the Inelastic Electron-Phonon Scattering Time for <u>In</u> -Pb Alloy Whiskers	296
	Final Note	299
	References	301
	List of Abbreviations	319
	List of Symbols	321
	Subject Index	335
