

Table of contents

Introduction	1
List of symbols	1
General remarks	3
Theoretical basis	3
Definitions and fundamental relations	3
Diamagnetism and diamagnetic corrections	5
Paramagnetic susceptibility of polycrystalline specimens	6
Paramagnetic anisotropy	7
Ligand field effects, high-spin and low-spin compounds and crossover situations	10
More detailed theory of magnetic susceptibilities and magnetism diagrams	11
Dimers and clusters, linear chain and planar magnetic systems	13
Long-range order: ferromagnetism, antiferromagnetism and ferrimagnetism	18
Arrangement of tables	20
Compounds listed, their designation and order	20
Presentation of experimental results	23
Selection and accuracy of data	23
Experimental methods	24
References	24
Literature coverage	24
Abbreviations	25
Selected diamagnetic ionic susceptibilities, Pascal constants, and one-electron spin-orbit coupling constants	28
Theoretical nomograms; calculated average magnetic moments as function of temperature, spin-orbit coupling, axial field splitting and orbital reduction	31
References for the introduction	41
Standard reference texts on magnetochemistry	41
General references to ligand field theory of magnetism	41
Additional references to the introduction	41
Tables of magnetic data on transition metal compounds	43
Reviews on magnetochemistry of coordination compounds published in 1973 and 1974	44
Selected references on theory and experimental methods in the magnetism of transition metal compounds (1973 and 1974)	44
Ligand field and MO theory of magnetism	44
Theory of intermolecular exchange interaction	44
Experimental methods in magnetism	45
References to crystal structure	45
 Magnetic susceptibility data	46
