PHOTODISINTEGRATION EXPERIMENTS WITH NUCLEAR EMULSIONS*

E. W. Titterton

CONTENTS

	PAGE
1. Introduction	1
2. The photographic plate method for photodisintegration studies	3
(i) General	3
(ii) Choice of emulsion	4
(iii) γ -ray sources	5
(iv) Identification of reactions	6
(v) Determination of Q -values	7
(vi) Search procedures	8
(vii) Corrections for loss of events	10
3. The photodisintegration process	11
(i) The compound nucleus picture	11
(ii) The absorption process at energies < 50 Mev	13
(iii) The giant resonances	15
(iv) The Goldhaber-Teller model	17
(v) The Levinger-Bethe theory	18
(vi) The break-up of the compound nucleus	22
(vii) The direct photoejection process	25
4. Selection rules arising from the charge-independence hypothesis	28
5. Reaction studies with photographic plates	30
(i) Light elements	30
(ii) Medium and heavy elements	43
(iii) Fission	51
6. Acknowledgments	51
References	52

SCINTILLATION SPECTROMETER STATISTICS

Ernst Breitenberger

CONTENTS

	PAGE
1. Introduction	56
2. Generating functions	58
3. Alternative events	59
4. Simultaneous events	60
5. Cascade events	62
6. The photon transfer	63
7. The secondary electron cascade	64
7.1 General	64
7.2 The stage gain variance	65
7.3 The tube gain variance	66
7.4 Interruptions of the cascade	68
7.5 The shape of the single electron line	69
7.6 The duration of the single electron pulse	69
7.7 Space charge effects	70
8. Aftereffects	71
9. The ideal scintillation line	74
10. The shape of the ideal line	75
11. Varying transfer efficiency	76
12. Voltage stabilization	79
13. Other sources of line width	80
13.1 Non-normal scintillation variance	80
13.2 Inhomogeneous luminescence yield	81
13.3 Interaction, edge and scattering effects	82
13.4 Space charge effects	83
13.5 Satellites	83
13.6 The collecting time constant	85
13.7 High counting rates	87
13.7 The electronic equipment	87
14. The shape of non-ideal lines	87
15. Natural and instrumental width	88
16. Comparison with the proportional counter	88
References and Notes added in proof	89

ISOTOPIC SPIN AND NUCLEAR REACTIONS

W. E. Burcham

CONTENTS

	PAGE
I. Introduction	171
II. The charge independence of nuclear forces	172
(a) General	172
(b) Symmetrical and anti-symmetrical states of the two-nucleon system	173
(c) The isotopic spin variable	175
(d) Description of charge independence in terms of isotopic spin	177
(e) Charge symmetry and charge parity	178
(f) Experimental evidence from high energy nucleon-nucleon scattering experiments	179
(g) Experimental evidence from low energy nucleon-nucleon scattering experiments	182
(h) Experimental evidence from meson phenomena	182
III. Consequences of the charge-independent Hamiltonian in low energy nuclear physics	186
(a) Classification of nuclear levels	186
(b) Experimental evidence for charge multiplets	189
(c) Isotopic spin and nuclear reactions involving heavy particles	195
(d) Isotopic spin and emission of γ -radiation	199
(e) Isotopic spin and photodisintegration	202
(f) Isotopic spin and beta-transitions	205
IV. Summary and conclusions	207
Appendix 1. The purity of charge states	208
Appendix 2. Determination of isotopic spin for the states of B^{10}	211

6

HEAVY IONS OF HIGH ENERGY

D. Walker

CONTENTS

	PAGE
1. Introduction	215
2. Cyclotron acceleration of heavy ions	216
(a) Ions of low charge	216
(b) Ions of high charge	217
(c) Historical and general	218
3. State of charge of heavy ions passing through matter	219
4. Range-energy relations for heavy ions	221
5. Delta rays	223
6. Nuclear reactions produced by fast heavy ions	224
(a) Reactions with heavy target nuclei	224
(b) Reactions in photographic emulsions	226
(c) Reactions with light target nuclei	227
7. Further possibilities	231

NUCLEAR PROPERTIES OF THE VERY HEAVY ELEMENTS

J. O. Newton

CONTENTS

	PAGE
I. Introduction	234
II. General theoretical considerations	235
1. The liquid drop model	235
2. The shell model	236
3. The unified nuclear model	237
III. Alpha particle decay	241
1. The decay energies	242
2. Half lives of the ground states of even-even nuclei	244
IV. Beta decay	247
1. Energy systematics	247
2. Selection rules and transition probabilities	248
V. The excited states	252
1. The even-even nuclei	252
2. The odd Z —even N nuclei	259
3. The odd N —even Z nuclei	264
4. The odd-odd nuclei	266
VI. Fission	267
1. Half lives for spontaneous fission	267
2. Photofission	268
3. Neutron induced fission	269
VII. Summary and discussion of the nuclear properties	270
1. Summary	270
2. Discussion	272
VIII. Experimental methods	275
1. Energy release in alpha decay	276
2. Energy release in beta decay	277
3. Internal conversion	278
4. Gamma rays	280

9

NEUTRON SPECTROSCOPY

D. J. Hughes

CONTENTS

	PAGE
I. Introduction	330
II. Neutron resonances	334
III. Experimental methods	337
(a) High energy	338
(b) Low energy	343
IV. Determination of level parameters	350
V. Survey of experimental results	356
