

CONTENTS

Constrained Variational Calculations for the Nuclear Many-Body Problem J. M. IRVINE	1
Intermediate Coupling Calculations for Light Nuclei in a Projected Hartree-Fock Basis M. BOUTEN and M. C. BOUTEN	55
Description of High Spin States A. FAESSLER, M. PLOSZAJCZAK and K. W. SCHMID	79
Nuclear Interactions for Medical Purposes DAPHNE F. JACKSON and D. J. BRENNER	143
Pion-Nucleus Scattering: Theory and Applications L. C. LIU and C. M. SHAKIN	207
Nuclear Physics with Hyperons B. POVH	245
Author Index	269
Subject Index	281
Contents of Previous Volumes	283

CONTENTS

1. INTRODUCTION	1
2. A HISTORICAL REVIEW	5
3. THE FORMALISM OF LOCV CALCULATIONS FOR NUCLEAR MATTER	11
4. RESULTS OF LOCV CALCULATIONS FOR NUCLEAR MATTER	17
4.1. Spin independent model calculations	17
4.2. Spin dependent model calculations	18
4.3. Realistic N - N interactions	21
5. SOLUTIONS TO THE OVERBINDING PROBLEM IN NUCLEAR MATTER	29
6. OTHER NUCLEAR FLUIDS	38
6.1. Asymmetric nucleon matter	38
6.2. Beta stable matter	41
7. THE CONVERGENCE OF LOCV CALCULATIONS AND THREE-BODY CLUSTER EFFECTS	45
8. FINITE NUCLEI	47
9. CONCLUSION	51
ACKNOWLEDGEMENTS	52
REFERENCES	52

CONTENTS

1. INTRODUCTION	55
2. INTERMEDIATE COUPLING IN A PHF BASIS	57
2.1. Description of the model	57
2.2. Details of the calculation	58
3. ENERGY SPECTRA	60
3.1. General results of the PHF calculation	61
3.2. Spectra of light nuclei	62
4. ELECTROMAGNETIC MOMENTS AND TRANSITIONS	66
4.1. Static moments	66
4.2. Electromagnetic transitions	67
4.2.1. ${}^6\text{Li}$ and ${}^7\text{Li}$	69
4.2.2. ${}^9\text{Be}$ and ${}^{11}\text{B}$	69
4.2.3. ${}^{10}\text{B}$	70
4.2.4. ${}^{12}\text{C}$	72
5. COMPARISON WITH OTHER CALCULATIONS FOR LIGHT NUCLEI	72
5.1. The shell-model calculation of Barker	72
5.2. The shell-model calculation of Cohen and Kurath	73
5.3. The molecular-orbital model calculations of the Kyoto group	74
6. DISCUSSION	75
ACKNOWLEDGEMENT	78
REFERENCES	78

CONTENTS

1. INTRODUCTION	80
2. DESCRIPTION OF BACKBENDING IN EVEN MASS NUCLEI	81
2.1. The experimental facts	81
2.2. The nature of the upper band	82
2.3. The Hartree-Fock-Bogoliubov approach	84
2.4. Results for the first bb anomaly	89
2.5. Backbending and quadrupole pairing	91
2.6. Backbending in the second half of the rare earth nuclei	94
2.7. Second anomaly of the moment of inertia	94
3. DESCRIPTION OF BACKBENDING BY MANY QUASI PARTICLE STATES	97
3.1. The concept of particle number parity for the HFB description of odd mass nuclei	97
3.2. Results for odd mass nuclei	100
4. ANGULAR MOMENTUM CONSERVING DESCRIPTION FOR HIGH SPIN STATES	103
4.1. Average angular momentum conservation in the cranking approach	103
4.2. Oscillating behaviour of backbending as a function of the nucleon number	108
4.3. The yrast-yrare interaction in an angular momentum conserving model	110

5. DE-EXCITATION AFTER HEAVY ION FUSION REACTIONS IN DEFORMED NUCLEI	117
5.1. Competition between statistical and collective γ -rays	117
5.2. Two maxima in the side feeding pattern	121
6. NUCLEAR STRUCTURE AT EXTREMELY HIGH ANGULAR MOMENTA	123
6.1. Equilibrium shapes of rotating nuclei	123
6.2. Stability against emission of particles and fission at high spins	127
6.3. Shell structure and yrast isomers at high spins	132
7. CONCLUSIONS	137
REFERENCES	139

CONTENTS

1. INTRODUCTION AND DEFINITIONS	144
1.1. Principles of diagnosis and therapy	144
1.2. Physical and biological effects of radiation	144
1.3. Principles of imaging	148
2. SOME FUNDAMENTAL PHYSICAL PROBLEMS	150
2.1. Introduction—the nature of the problems	150
2.2. Experimental information on light nuclei	151
2.2.1. <i>Neutron scattering and reactions</i>	151
2.2.2. <i>Proton scattering and reactions</i>	153
2.2.3. <i>Interactions with light and heavy ions</i>	156
2.2.4. <i>Structure of light nuclei</i>	160
2.3. Pre-equilibrium processes	162
2.3.1. <i>Pre-equilibrium models</i>	162
2.3.2. <i>Complex particle emission in the pre-equilibrium phase</i>	165
2.3.3. <i>Deficiencies in the pre-equilibrium models applied to light targets</i>	167
2.4. Nuclear interactions in pionic atoms	169
2.4.1. <i>General features for light atoms</i>	169
2.4.2. <i>One-step direct reaction model</i>	172
2.4.3. <i>Direct reaction model with final state interactions</i>	177
2.5. Behaviour of pionic atoms in complex materials	181
2.5.1. <i>Formation and de-excitation of pionic atoms</i>	181
2.5.2. <i>Capture on free and chemically bound hydrogen</i>	183
2.5.3. <i>Effects of chemical and physical composition</i>	185
2.5.4. <i>Model of large mesic molecules</i>	186
2.5.5. <i>Information on capture in biological materials</i>	188
3. NUCLEAR RADIOGRAPHY AND TOMOGRAPHY	189
3.1. End-of-range radiography	189
3.2. Nuclear scattering radiography	191
3.3. Charged particle tomography	195
4. NUCLEAR PROJECTILES IN THERAPY	196
4.1. Heavy particle therapy	196
4.2. Heavy charged particle therapy and CT scanning	198
REFERENCES	199

† Present address: Los Alamos Scientific Laboratory, New Mexico, U.S.A.

CONTENTS

1. INTRODUCTION	207
2. COVARIANT OPTICAL MODELS	209
3. THE FIRST-ORDER POTENTIAL	211
3.1. The triangle diagram	211
3.2. Energy shift and Fermi broadening	212
3.3. Limitations of the fixed-scatterer approximation	215
4. THE SECOND-ORDER POTENTIAL	218
4.1. Parametrization of the second-order potential	219
4.2. Analysis of low-energy data	220
4.3. The resonance region	223
4.4. Systematic features of the second-order potential	228
5. A GENERAL THEORY OF THE OPTICAL POTENTIAL	231
5.1. General properties of the optical potential	232
5.2. Construction of optical models	234
5.3. Pion absorption and the optical potential	236
6. SUMMARY AND OUTLOOK	237
6.1. Salient features of the optical potential	237
6.2. Elastic pion-nucleus scattering and nuclear structure	238
6.3. Scattering amplitudes and cross sections	238
6.4. Some outstanding problems	241
ACKNOWLEDGEMENT	241
REFERENCES	241
APPENDIX: Explicit formulae for the first-order potential	242

NUCLEAR PHYSICS WITH HYPERONS
