

# CONTENTS

	Foreword	vii
Chapter 1.	Cosmic particles H. FRITZSCHE	1
Chapter 2.	The consistency problems of large scale structure D. N. SCHRAMM	51
Chapter 3.	The constancy of physics J. M. IRVINE and R. HUMPHREYS	59
Chapter 4.	Grand unified theories and the double beta-decay A. FAESSLER	85
Chapter 5.	Nuclear matter under extreme conditions H. MÜTHER	97
Chapter 6.	The spectrum of the microwave background as a probe of the early universe G. DE ZOTTI	117
Chapter 7.	Does thermodynamics require our cosmos to undergo a series of contraction/expansion cycles? E. RECAMI, J. M. MARTINEZ and V. T. ZANCHIN	143
Chapter 8.	Galaxy clustering and small-scale CBR anisotropy con- straints on galaxy origin scenarios F. LUCCHIN	153
Chapter 9.	The chemical evolution of galaxies C. CHIOSI	173
Chapter 10.	Type II supernova models. Nucleosynthesis and isotopic anomalies W. HILLEBRANDT	215
Chapter 11.	A critical study of type II supernovae: equations of state and general relativity S. KAHANA	231
Chapter 12.	The fate of accreting white dwarfs: Type I supernovae vs. collapse K. NOMOTO	249
Chapter 13.	Late stages of massive star evolution and nucleosynthesis K. NOMOTO and M. HASHIMOTO	267

Chapter 14.	Binary stars as sources of iron and of s-process isotopes I. IBEN, JR.	287
Chapter 15.	Supernova explosion in a very massive star M. F. EL EID and N. LANGER	295
Chapter 16.	The origin of the light nuclides M. ARNOULD	305
Chapter 17.	Isotope abundance anomalies and the early solar system (some) facts and (some) implications F. BEGEMANN	349
Chapter 18.	Laboratory approaches of nuclear reactions involved in primordial and stellar nucleosynthesis C. ROLFS	365
Chapter 19.	The s-process of stellar nucleosynthesis G. SCHATZ	393
Chapter 20.	Nuclear beta strength, neutrino mass and cosmology H. V. KLAPDOR	419
	Contents of Previous Volumes	457
