Preface	iv
The Investigation of Eye Movements. By MARY P. LORD and W. D. WRIGHT .	1
Recent Advances in Infra-Red Solar Spectroscopy. By L. GOLDBERG . . .	24
Shock Waves and the Propagation of Finite Pulses in Fluids. By W. G. PENNEY and H. H. M. PIKE	46
Ferromagnetism: Magnetization Curves. By EDMUND C. STONER	83
Radio Astronomy. By M. RYLE	184
Planetary and Satellite Atmospheres. By GERARD P. KUIPER	247
Paramagnetic Relaxation Effects. By A. H. COOKE	276
Cyclic Accelerators. By J. H. FREMLIN and J. S. GOODEN	295
Mesons. By C. F. POWELL	350

THE INVESTIGATION OF EYE MOVEMENTS

BY MARY P. LORD AND W. D. WRIGHT
Imperial College of Science and Technology, London S.W.7

CONTENTS

	PAGE
§ 1. Introduction.....	1
§ 2. The eye in its orbit	4
§ 3. Classification of eye movement techniques	7
§ 4. Experimental investigations and results	9
(i) After-image experiments	9
(ii) Counting techniques	10
(iii) Direct visual observation	10
(iv) Recording by means of an attachment to the eye.....	13
(a) Mechanical recording.....	13
(b) Photographic recording	13
(c) Photoelectric recording	14
(v) Photography of the eyes	14
(vi) Recording of the corneal reflex.....	15
(a) Photographic recording	15
(b) Photoelectric recording	16
(vii) Recording of the corneal-retinal potential difference.....	18
§ 5. Discussion	19
Acknowledgments	22
References	22

RECENT ADVANCES IN INFRA-RED SOLAR SPECTROSCOPY

BY L. GOLDBERG

McMath-Hulbert Observatory of the University of Michigan, Pontiac, Michigan

CONTENTS

	PAGE
§ 1. Introduction	24
§ 2. Instrumentation	26
§ 3. An atlas of the infra-red solar spectrum	28
§ 4. Solar lines	29
Factors governing the appearance of solar lines	34
§ 5. Telluric lines	35
(i) Carbon dioxide	36
(ii) Methane	41
(iii) Nitrous oxide	42
(iv) Water vapour	44
Acknowledgments	44
References	44

SHOCK WAVES AND THE PROPAGATION OF FINITE PULSES IN FLUIDS

BY W. G. PENNEY AND H. H. M. PIKE
Armament Research Establishment, Ministry of Supply

CONTENTS

	PAGE
§ 1. Introduction	46
§ 2. Shock wave relationships : Some numerical values	48
(i) Derivation of the Rankine-Hugoniot equations	48
(ii) The thickness of the shock transition zone	51
(iii) Equations of state and shock wave properties in various fluids	52
§ 3. Reflection, refraction and diffraction of plane shock waves	55
(i) Normal reflection of shock waves by a rigid wall.....	58
(ii) Oblique reflection at a rigid wall	58
(iii) Reflection at a free surface.....	60
(iv) Normal reflection at an interface between two fluids	63
(v) Oblique reflection at an interface	64
(vi) Diffraction problems.....	65
§ 4. Similarity solutions of one independent variable	68
§ 5. Non-similarity solutions	71
(i) A generalization of Riemann's characteristics.....	71
(ii) Transition of a simple expanding wave into a shock	75
(iii) Calculation of the propagation of shock waves caused by explosions	78
(iv) Physiological effects of blast	81
Acknowledgments	81
References	82

FERROMAGNETISM: MAGNETIZATION CURVES

By EDMUND C. STONER

Department of Physics, The University, Leeds

CONTENTS		PAGE
§ 1. Introduction		83
§ 2. Single crystals		85
(i) Introductory		85
(ii) Experimental methods and results		86
(iii) Theory of magnetization curves		97
(iv) Atomic theory		103
§ 3. Domain structure		107
(i) Theoretical and general		107
(ii) Powder patterns		117
(iii) Discontinuities in magnetization: the Barkhausen effect		123
(iv) Related investigations		129
§ 4. The analysis of magnetization curves		132
(i) Introductory		132
(ii) Boundary movements		134
(iii) Reversible rotational processes		141
(iv) Rotational processes and hysteresis		145
(v) Magneto-thermal effects		150
§ 5. Magnetic materials		157
(i) Introductory		157
(ii) General survey		158
(iii) Iron-silicon and nickel-iron alloys		163
(iv) Permanent-magnet materials		169
§ 6. Conclusion		177
Acknowledgments		179
References		180

RADIO ASTRONOMY

By M. RYLE

Cavendish Laboratory, Cambridge

CONTENTS

	PAGE
§ 1. Introduction	185
§ 2. The first astronomical observations at radio wavelengths	187
§ 3. The expression of random radio-frequency fields in terms of equivalent temperatures	188
§ 4. The measurement of small random radio fields	190
The measurement of small radio-frequency noise powers	190
§ 5. The observation of a small source against the background radiation of the galaxy	193
(a) The 'pencil' beam	194
(b) 'Interference' method	195
(c) The detection of discrete sources in the galaxy	197
(d) The measurement of the diameter and position of a source	199
§ 6. The measurement of polarization	201
§ 7. Experimental observations of solar radiation	203
(a) Observations on wavelengths shorter than 1 m	204
(b) Observations on wavelengths greater than 1 m	208
§ 8. Experimental observations of galactic radiation	214
(a) The general radiation from the galaxy	214
(b) The discovery of discrete sources in the galaxy	215
(c) The distribution of the discrete sources	218
(d) The polarization of the radiation from the discrete sources	219
(e) The cause of the fluctuations of intensity	220
§ 9. Theories of solar radiation	222
(a) Application of the magneto-ionic theory to the solar atmosphere	223
(b) The types of mechanism suggested to account for the emission of radio waves from the sun	225
(c) Radiation from the undisturbed sun	226
(d) The production of high-energy electrons in the solar atmosphere	228
(e) The enhanced radiation from sunspots	229
(i) Theories based on 'equilibrium' mechanisms	229
(ii) Theories based on the coherent oscillation of a number of electrons	232
(f) Detailed examination of the mean electron energy maintained by an electric field	233
(g) Theories of the rapid fluctuations associated with sunspots and the sudden large increases associated with chromospheric flares	235
§ 10. Theories of galactic radiation	236
(a) Origin in the interstellar gas	236
(b) The nature of the sources	237
(c) Mechanisms for the emission of intense radiation from the sources	238
(d) The origin of the total galactic radiation	239
§ 11. Future developments in radio astronomy	242
(a) The study of the solar atmosphere	242
(b) The study of stellar envelopes	243
(c) The origin of cosmic rays	244
(d) The structure of the galaxy	244
Acknowledgments	245
References	245

PLANETARY AND SATELLITE ATMOSPHERES

By GERARD P. KUIPER

Yerkes Observatory, University of Chicago

CONTENTS

	PAGE
§ 1. Introduction	247
§ 2. Criteria on the presence of a planetary atmosphere	247
§ 3. Spectroscopic observations of planetary atmospheres	250
§ 4. Visual and photographic observations of planetary atmospheres	253
§ 5. Observational results and interpretation	257
Mercury	257
Venus	258
Mars	261
Jupiter	266
Saturn	268
Uranus and Neptune	271
Pluto	272
General remarks	272
Appendix	272
References	273

PARAMAGNETIC RELAXATION EFFECTS

By A. H. COOKE
The Clarendon Laboratory, Oxford

CONTENTS

	PAGE
§ 1. Introduction	276
§ 2. Theory of paramagnetic relaxation	278
§ 3. Spin-lattice relaxation	279
Interpretation of spin-lattice relaxation times	281
§ 4. Spin-spin relaxation	283
Interpretation of spin-spin relaxation times	284
§ 5. Experimental methods	287
Absorption measurements at radio frequencies	287
Dispersion measurements	288
Measurements at liquid helium temperatures	289
§ 6. Specific heats	291
Interpretation of magnetic specific heats	292
References	293

CYCLIC ACCELERATORS

BY J. H. FREMLIN AND J. S. GOODEN

Birmingham University

CONTENTS

	PAGE
§ 1. Introduction	295
§ 2. Fixed-frequency cyclotron	296
(i) General principles	296
(ii) Detailed consideration of the different regions of acceleration	298
(a) Ion source and initial conditions	298
(b) Conditions required during the main part of the acceleration if the maximum energy is to be achieved	302
(c) Conditions required for extraction of the beam	307
(iii) The magnet	309
(iv) The radio-frequency system	310
(a) The generator	310
(b) Construction of dees and resonant lines	312
(v) Limits of the fixed-frequency cyclotron	315
§ 3. The frequency-modulated cyclotron, or synchro-cyclotron	317
(i) Effect of frequency variation	317
(ii) Early experimental work	319
(iii) The present position of the synchro-cyclotron	321
§ 4. Betatrons	324
(i) Introduction	324
(ii) Principle of operation	325
(iii) Physical construction	327
(iv) Operation	330
(v) Future possibilities	331
§ 5. Electron synchrotron	331
(i) General principles	331
(ii) Physical construction	334
(iii) Operation	336
(iv) Future possibilities	336
§ 6. The proton synchrotron	337
(i) General principles	337
(ii) Physical construction	340
(iii) Performance and future prospects	345
§ 7. Conclusion	346
Acknowledgments	347
References	348

MESONS

BY C. F. POWELL

H. H. Wills Physical Laboratory, The University, Bristol

CONTENTS

	PAGE
§ 1. Introduction	351
§ 2. Historical survey	352
(i) The ' heavy quanta ' of Yukawa	352
(ii) Discovery of the μ -mesons	353
(iii) The fate of the μ -mesons	353
(iv) Discovery of the π -mesons	356
(v) Nomenclature	358
§ 3. Mass and mode of decay of the π -mesons	359
(i) The decay of π^+ -particles	359
(ii) Mass of the π -particles : Method A; Residual range and grain-density	361
(iii) Method B; Scattering and residual range	364
(iv) Method C; Momentum and residual range	365
(v) Method D; Grain-density and scattering	368
(vi) Method E; Ratio of the ranges and of the momenta of protons and π -particles	371
(vii) The nature of the neutral particle emitted during μ -decay	372
§ 4. Properties of the π -mesons	373
(i) Charge of the π -particles	373
(ii) Life-time of the π -particles	373
(iii) Disintegrations produced by π^- -particles	375
(iv) Capture of π^- -particles by particular elements	377
(v) Spin of the π -particles	378
(vi) β -decay of the π -particles	379
§ 5. Properties of the μ -mesons	379
(i) Mass of the μ -particles	379
(ii) The decay of the μ -meson	380
(iii) Nature of the decay particles	382
(iv) Life-time of the μ -particles	383
(v) Nuclear interactions of μ^- -particles	384
§ 6. Artificial production of π -mesons	387
(i) Excitation curve for the production of mesons	387
(ii) Energy spectrum of the mesons	389
(iii) Ratio of the numbers of π^+ and π^- -particles	390
(iv) Experiments with γ -radiation	391
(v) Production of mesons by energetic neutrons	391
§ 7. Creation of π -mesons by cosmic radiation	392
(i) Ejection of π -particles of relatively low energy during nuclear explosions	392
(ii) Production of ' showers ' of penetrating particles	393
(iii) Nature of the shower particles	395
(iv) Distribution in energy of the mesons of the penetrating showers	397
(v) Nuclear interactions of the shower particles	398
(vi) Multiplicity of production of mesons	400
(vii) Production of ' showers ' at great depths underground	401
§ 8. Neutral mesons	402
(i) Transmutation of neutral particles into quanta	402
(ii) Experimental evidence for the existence of neutral mesons	404

(iii) Evidence for the production of neutral mesons by cosmic radiation	406
(iv) Mass and energy of neutral mesons in penetrating showers	407
(v) Life-time and frequency of production of neutral mesons	409
(vi) Spin and parity of the π^0 -particles	411
§ 9. Evidence for the existence of mesons of other types	411
(i) Evidence for the existence of τ -mesons	411
(ii) Varitrons	414
(iii) Summary of evidence	416
§ 10. Production of mesons in the atmosphere	416
(i) The primary cosmic radiation	417
(ii) Disintegrations of heavy primary particles	418
(iii) Origin of the 'hard' and 'soft' components	418
§ 11. Outstanding problems and perspectives	420
Acknowledgments	422
References	422
