The measurement of the optical transfer functions of lenses

K. ROSENHAUER AND K.-J. ROSENBRUCH

Physikalisch-Technische Bundesanstalt, Braunschweig, Germany

Contents

	Page
1. Aberrations and resolving power	1
2. Optical transfer function	2
3. Qualities of the optical transfer function	3
4. Basic principles of the theory of optical transfer	3
5. Methods for measuring the optical transfer function	7
5.1. Mechanical and optical demands	7
5.2. Basic components of the systems	7
6. Direct measuring methods: grating test methods	7
7. Indirect measuring methods	11
7.1. Slit and edge methods	11
7.2. Interference methods	13
7.3. Determination of geometrical and optical aberrations	16
8. Calculation of the optical transfer function (general solution)	16
9. Comparison of the various methods	17
10. Application of the optical transfer function methods to other regions	19
11. Optical transfer function for polychromatic light	21
12. Different representations of the optical transfer function curves	21
13. Image-quality criteria	22
References	24

Recent applications of semiconductor techniques in the study of nuclear radiations

E. M. GUNNERSEN

Atomic Weapons Research Establishment, Aldermaston, Berks.

Contents

	Page
1. Introduction	28
2. The semiconductor nuclear particle counter	29
2.1. Mechanism of operation of semiconductor counters	29
2.2. Types of semiconductor counters and their fabrication techniques	46
2.3. Irradiation damage effects in semiconductor counters	54
3. Particular applications of semiconductor counters to the analysis of radiations	58
3.1. Nuclear physics	58
3.2. Space physics	70
3.3. Medical, biological and chemical applications	71
4. Channelling and ion implantation techniques in semiconductors	72
4.1. Channelling of ions in semiconductor crystal lattices	72
4.2. The ion implantation technique in device fabrication	76
5. Recent applications of semiconductor devices in the study of irradiation damage	77
5.1. Capacity measurements on p-n junctions	77
5.2. Carrier concentration measurements in field effect devices	81
5.3. The excess current in Esaki diodes	83
5.4. The short circuit ionization current in p-n junctions and solar cells	85
5.5. Spectral response of illuminated solar cells and current gain measurements on transistors	88
Acknowledgments	89
References	89

The Gunn effect

P. N. BUTCHER

Royal Radar Establishment, Malvern, Worcs.

Contents

	Page
1. Introduction	98
2. The search for a negative differential conductivity	99
3. Theory of the electron-transfer mechanism	101
3.1. Conduction-band structure	101
3.2. Boltzmann's equations and scattering mechanisms	102
3.3. The displaced Maxwellian approximation	105
3.4. Displaced Maxwellian calculations for polar crystals excluding intervalley scattering	106
3.5. Displaced Maxwellian calculations for polar crystals including intervalley scattering	109
3.6. The approximation of nearly elastic collisions	113
4. Theory of space-charge instabilities	115
4.1. Basic equations	115
4.2. Steady state solution	118
4.3. Small signal perturbations	119
4.4. The ultimate form of the space-charge instability	122
4.5. Uniformly propagating stable domains	124
5. Experimental studies of the electron-transfer mechanism	133
5.1. The effect of stress on the threshold field	133
5.2. Investigations of the velocity-field characteristic	134
5.3. Dependence of the threshold field on sample length	137
6. Experimental studies of uniformly propagating stable domains	138
6.1. Basic properties	138
6.2. Other effects	141
7. Conclusion	142
Acknowledgments	142
Appendixes	143
Appendix 1. Integrals involving $[\partial f_i(\mathbf{k})/\partial t]_F$	143
Appendix 2. Integrals involving $[\partial f_i(\mathbf{k})/\partial t]_{ii}^{(0)}$	143
Appendix 3. Integrals involving $[\partial f_i(\mathbf{k})/\partial t]_{ii}^{(a)}$	143
Appendix 4. Integrals involving $[\partial f_i(\mathbf{k})/\partial t]_{ij}^{(ij)}$	144
Appendix 5. Evaluation of the scattering integrals to first order in the displacement	145
Appendix 6. Scattering formulae in the approximation of nearly elastic collisions	145
References	146

Chemico-physical processes in shock waves

I. R. HURLE

Shell Research Ltd, Thornton Research Centre, Chester

Contents

	Page
1. Introduction	150
2. Concepts of shock waves	151
2.1. Formation of a shock wave	151
2.2. Structure of a shock wave	153
3. Theory of shock waves	154
3.1. Basic relations	154
3.2. Ideal gases	156
3.3. Real gases	157
3.4. Reflected shock waves	160
4. Production of shock waves	160
5. Limitations of shock tubes	162
5.1. Observation time	162
5.2. Flow irregularities	163
5.3. True and apparent particle times	164
6. Instrumentation of shock tubes	165
7. Relaxation measurements in shock waves	166
7.1. Translational and rotational relaxations	168
7.2. Vibrational relaxation	170
8. Dissociation measurements in shock waves	173
8.1. Dissociation in dilute gases	174
8.2. Dissociation in pure gases	175
8.3. Non-equilibrium aspects of dissociation	176
9. Relaxation measurements in expanding flows	178
10. Ionization measurements	179
10.1. Continuum states and forced ionization	181
11. Spectroscopic measurements	182
11.1. Spectra and oscillator strengths	183
11.2. Electronic excitation processes	183
12. Recent applications of shock waves	184
References	186

The theory of paramagnetic relaxation

K. W. H. STEVENS

Department of Physics, University of Nottingham

Contents

	Page
1. Introduction	189
2. Elements of spin-lattice relaxation	191
2.1. The harmonic lattice	193
2.2. The phonon bottleneck	196
2.3. Dipolar interactions	198
2.4. Rate equations	201
3. The crystal-field theory of the dynamical interaction	204
4. The transition probabilities	210
4.1. The direct process	211
4.2. The Raman effect	215
5. The dynamical spin Hamiltonian	220
6. Conclusion	224
Acknowledgments	225
References	225

Unitary symmetry

J. M. CHARAP, R. B. JONES AND P. G. WILLIAMS

Department of Physics, Queen Mary College, London

Contents

	Page
1. Introduction	227
2. Charge and baryon gauge groups: $U(1) \otimes U(1)$	229
3. Isotopic spin: $SU(2)$	231
4. Multiplets and the Wigner–Eckart theorem	233
5. Consequences of $SU(2)$ symmetry	237
6. Breaking of $SU(2)$ symmetry by electromagnetism	239
7. Isospin currents and the weak interactions	242
8. Strange particles: hypercharge	246
9. The group $SU(3)$	248
10. Reduction formulae: the eightfold way	254
11. The Gell-Mann–Okubo mass formula	261
12. U spin and electromagnetic interactions	266
13. The Cabibbo theory of weak interactions	270
14. Physical consequences of $SU(3)$ symmetry	274
15. Higher symmetries: $SU(6)$ and its generalizations	275
16. Outlook	280
Bibliography	282
References	282

Nuclear reactors as research instruments

J. WALKER

Physics Department, University of Birmingham

Contents

	Page
1. Introduction	285
2. The reactor and its radiations	286
2.1. Principles of operation	286
2.2. Component parts	288
2.3. Radiations available	289
2.4. Neutron spectra	290
3. Forms of research reactor	293
3.1. The classification according to flux or other factors	293
3.2. The different structural forms	294
3.3. Pulsed reactors	301
3.4. Underground nuclear explosions as radiation sources	306
4. Use of radiations internally ('in-pile' experiments)	307
4.1. Facilities	307
4.2. Examples of applications	309
5. Use of radiations externally	314
5.1. Facilities	314
5.2. Examples of applications	319
Acknowledgments	328
References	328

Plasma stability in magnetic traps

I. Magnetohydrodynamic stability theory

J. D. JUKES

Culham Laboratory, Culham, Abingdon, Berks.

Contents

	Page
1. Introduction	333
2. Magnetic wells and open systems	336
2.1. Minimum- B geometries	336
2.2. Stability of a special class of equilibria in magnetic wells	338
2.3. More general equilibria and their stability in magnetic wells	341
3. Departures from idealized magnetohydrodynamics	344
3.1. Some effects of real fluids and a model	344
3.2. Gravitational resistive instabilities and quasi-modes	346
3.3. Effects of finite ion mass	350
3.4. Gravitational resistive instability including that discussed in § 3.3	352
3.5. Resistive instabilities driven by density gradients and by longitudinal current	354
3.6. Resistive tearing instability	356
3.7. Resistive instabilities due to a temperature gradient	358
4. Stability of closed systems	359
4.1. Basic closed systems	359
4.2. Stability of pinches	361
4.3. Average-magnetic-well (negative- V'') geometries	362
4.4. Resistive instabilities in average magnetic wells	367
5. Conclusions	371
Acknowledgments	372
References	372
