The theory of nuclear energy levels. J. M. IRVINE . . . . .	1
Macroscopic quantum effects in superfluids. W. F. VINEN . . . . .	61
Anharmonic crystals. R. A. COWLEY . . . . .	123
Stellar evolution. R. J. TAYLER . . . . .	167
Electrons in low-mobility and disordered semiconductors: theory of transport and related optical phenomena. M. I. KLINGER . . . . .	225
Plasma stability in magnetic traps: II—Micro-stability theory. J. D. JUKES	305
Megagauss magnetic fields. F. HERLACH . . . . .	341

# The theory of nuclear energy levels

J. M. IRVINE†

Laboratory of Nuclear Studies, Cornell University, Ithaca, New York, U.S.A.

## Contents

	Page
1. Introduction . . . . .	1
2. The liquid-drop model . . . . .	2
2.1. Vibrational states . . . . .	2
2.2. Rotational states . . . . .	5
3. The shell model . . . . .	9
3.1. Basic assumptions . . . . .	9
3.2. Configuration mixing . . . . .	14
3.3. Double closed-shell nuclei . . . . .	15
3.4. Nuclei with two valence particles or holes . . . . .	20
3.5. The 1p- and 1f-shell nuclei . . . . .	24
3.6. More complex configurations . . . . .	27
4. Nuclear correlations . . . . .	30
4.1. Quasi-particles . . . . .	30
4.2. The particle-hole random phase approximation . . . . .	31
4.3. BCS pairing correlations . . . . .	33
5. The extended shell model . . . . .	37
5.1. Moments of inertia . . . . .	38
5.2. The Nilsson scheme . . . . .	39
5.3. Deformed-state admixtures in the spherical shell model . . . . .	42
6. Self-consistent nuclear structure . . . . .	47
6.1. The Hartree-Fock equations . . . . .	48
6.2. The reaction matrix . . . . .	52
7. Conclusions . . . . .	55
Acknowledgments . . . . .	56
References . . . . .	56

# Macroscopic quantum effects in superfluids

W. F. VINEN

Department of Physics, University of Birmingham

## Contents

	Page
1. Introduction . . . . .	62
2. The phenomenological condensate wave function . . . . .	63
2.1. Condensation in an ideal Bose gas and in a Bose liquid . . . . .	63
2.2. Uniform superfluid flow in a Bose superfluid . . . . .	64
2.3. Non-uniform superflow in a Bose superfluid: the condensate wave function and the quantization of superfluid circulation . . . . .	66
2.4. The condensate wave function and superflow in an uncharged Fermi superfluid . . . . .	68
2.5. Superflow in a superconductor and the quantization of flux . . . . .	69
2.6. Long-range order: the condensate wave function as an order parameter . . . . .	72
2.7. Weakly coupled superfluid systems: Josephson tunnelling . . . . .	75
2.8. Free vortices: rotating helium and the mixed state of a type II superconductor . . . . .	77
2.9. Time dependence of the condensate wave function: the a.c. Josephson effect and the superfluid equation of motion . . . . .	80
3. Experimental evidence . . . . .	83
3.1. The quantization of circulation in superfluid helium . . . . .	83
3.2. The quantization of flux in a superconducting ring . . . . .	86
3.3. Experiments on the variation of critical temperature with applied magnetic field in superconducting cylinders . . . . .	89
3.4. Experiments on Josephson tunnelling and quantum interferometers . . . . .	92
3.5. Experiments on free quantized vortices . . . . .	100
3.6. Conclusions . . . . .	106
4. Theoretical discussion . . . . .	106
4.1. The condensate . . . . .	107
4.2. Ordinary superfluid flow . . . . .	113
4.3. Superflow between weakly coupled systems . . . . .	116
Acknowledgments . . . . .	119
References . . . . .	119

# Anharmonic crystals

R. A. COWLEY†

Chalk River Nuclear Laboratories, Chalk River, Ontario, Canada

## Contents

	Page
1. Introduction . . . . .	124
2. Interatomic forces . . . . .	126
2.1. The harmonic approximation . . . . .	126
2.2. The anharmonic potential . . . . .	128
2.3. Ionic crystals . . . . .	130
2.4. Inert-gas solids . . . . .	132
2.5. Metals . . . . .	132
2.6. Semiconductors . . . . .	134
3. Lifetimes and frequency shifts of phonons . . . . .	135
3.1. Theory . . . . .	135
3.2. Infra-red absorption . . . . .	137
3.3. Neutron and Raman scattering . . . . .	138
3.4. Multi-phonon processes . . . . .	140
3.5. Comparison of experiment and theory . . . . .	142
4. Velocity of sound . . . . .	147
4.1. The collisionless region . . . . .	147
4.2. The thermodynamic régime . . . . .	148
4.3. Third-order elastic constants . . . . .	150
4.4. Second sound . . . . .	152
4.5. Thermal conductivity . . . . .	153
5. Thermodynamic effects . . . . .	154
5.1. Thermal expansion . . . . .	154
5.2. The free energy . . . . .	156
5.3. The quasi-harmonic approximation . . . . .	157
6. Very anharmonic crystals . . . . .	158
6.1. Displacive ferroelectrics . . . . .	158
6.2. Green function theories . . . . .	160

# Stellar evolution

R. J. TAYLER

Astronomy Centre, School of Mathematical and Physical Sciences,  
University of Sussex, Falmer, Sussex

## Contents

	Page
1. Introduction . . . . .	168
2. Observations bearing on stellar evolution . . . . .	172
2.1. Types of observational information . . . . .	172
2.2. General character of observations . . . . .	173
2.3. Star clusters . . . . .	177
2.4. Questions posed for theory . . . . .	178
3. Introduction to stellar structure and evolution . . . . .	179
3.1. The equations of stellar structure . . . . .	179
3.2. The physics of stellar interiors . . . . .	181
3.3. Schematic life history of a star . . . . .	184
3.4. Main-sequence stellar structure . . . . .	185
4. Pre-main-sequence evolution . . . . .	188
4.1. Star formation . . . . .	188
4.2. Pre-main-sequence contraction . . . . .	189
4.3. Detailed calculations of immediate pre-main-sequence evolu- tion . . . . .	191
4.4. Comparison with observation . . . . .	193
4.5. Early solar evolution and the origin of the solar system . . . . .	194
5. Post-main-sequence evolution . . . . .	195
5.1. Historical introduction . . . . .	195
5.2. Factors influencing post-main-sequence evolution . . . . .	196
5.3. Evolution of relatively massive stars . . . . .	198
5.4. Evolution of low-mass stars . . . . .	200
5.5. The ages of star clusters and the Sun . . . . .	202
6. Advanced evolutionary stages . . . . .	203
6.1. Supernovae . . . . .	204
6.2. Horizontal branch stars . . . . .	205
6.3. Planetary nebulae and white dwarfs . . . . .	206
7. The intrinsic variable stars . . . . .	208
7.1. Introduction . . . . .	208
7.2. RR Lyrae stars . . . . .	210
7.3. Cepheid variables . . . . .	210
8. Non-spherical stars . . . . .	212
8.1. General discussion . . . . .	212
8.2. Evolution of close binaries . . . . .	215
9. Concluding remarks . . . . .	217

# Electrons in low-mobility and disordered semiconductors: theory of transport and related optical phenomena

M. I. KLINGER

Institute of Semiconductors, Academy of Sciences of the U.S.S.R., Leningrad, U.S.S.R.

## Contents

	Page
I. Electrons in low-mobility semiconductors	
1. Introduction . . . . .	226
1.1. The low-mobility problem in semiconductor physics . . . . .	226
1.2. The polaron problem in solid state theory . . . . .	228
2. The basic Hamiltonian: description of small polarons . . . . .	229
3. On the transitions and the diffusion of localized polarons . . . . .	235
4. Small-polaron transport in a semiconductor (the Condon case): general considerations and relations . . . . .	238
4.1. Statement of the problem: general relations . . . . .	238
4.2. The basic band-transport equation for small polarons . . . . .	245
4.3. Criteria of the theory: regions of hopping and band transport . . . . .	248
5. Longitudinal and transverse small-polaron conductivity and Hall effect . . . . .	251
5.1. Static and non-stationary drift mobility . . . . .	251
5.2. Transverse mobility and the Hall effect . . . . .	258
6. Characteristic properties of optical phenomena related to small-polaron transport . . . . .	264
6.1. General notes . . . . .	264
6.2. The small-polaron optical absorption coefficient . . . . .	265
6.3. The Faraday angle $\theta_F^{(D)}(\omega)$ . . . . .	270
7. Thermoelectric phenomena in small-polaron transport . . . . .	270
8. On some fundamental characteristic properties of small-polaron hopping transport . . . . .	273
8.1. Fundamental properties of the time correlator for small-polaron current fluctuations . . . . .	273
8.2. Stochastic semi-phenomenological treatment of hopping transport . . . . .	274
8.3. Stochastic properties and transport equations for hopping transport . . . . .	276
II. On electron transport in disordered crystalline semiconductors	
9. Introduction . . . . .	280
9.1. Some general considerations . . . . .	280
9.2. The energy spectral density $g(E)$ . . . . .	281
9.3. The phonon-frequency spectrum . . . . .	283
9.4. Electron transport in disordered lattices . . . . .	283
10. Hopping transport in a disordered lattice . . . . .	284
10.1. Recent considerations and models in the theory of hopping transport in disordered lattices . . . . .	284
10.2. Electron transport in impurity bands . . . . .	296

	Page
11. Concluding remarks . . . . .	297
11.1. Basic characteristic small-polaron transport and optical effects (summary) . . . . .	297
11.2. Some generalizations of hopping transport theory (conclusion)	299
References . . . . .	300

# Plasma stability in magnetic traps

## II. Micro-stability theory

J. D. JUKES†

Culham Laboratory, Culham, Abingdon, Berks.

### Contents

	Page
1. Introduction . . . . .	306
2. Low-frequency instabilities in inhomogeneous plasma . . . . .	306
2.1 Low-frequency waves . . . . .	306
2.2. Drift waves . . . . .	307
2.3. Electrostatic branches . . . . .	310
2.4. Electron drift waves in plasma with thermal gradient . . . . .	311
2.5. Finite ion Larmor radius effects . . . . .	312
2.6. Ion drift wave . . . . .	313
2.7. Physical explanation of drift wave instability . . . . .	314
2.8. Trapped-particle instabilities . . . . .	316
3. Stabilization and localization of drift waves . . . . .	319
3.1. Localization . . . . .	319
3.2. Ion damping . . . . .	319
3.3. Analysis of shear effects . . . . .	320
3.4. Electron drift wave stabilization . . . . .	322
3.5. Ion drift wave stabilization . . . . .	324
4. Intermediate- and high-frequency instabilities . . . . .	324
4.1. High-frequency drift waves . . . . .	324
4.2. Ion drift-cyclotron instability . . . . .	326
4.3. Loss-cone velocity-space instability . . . . .	328
4.4. Anisotropy instabilities . . . . .	329
4.5. Limits of open-trap stability . . . . .	331
5. Turbulent diffusion of plasma . . . . .	332
5.1. Micro-instabilities and turbulence . . . . .	332
5.2. Weak turbulence . . . . .	333
5.3. Diffusion . . . . .	334
5.4. Convective cells . . . . .	336
6. Conclusions . . . . .	337
