Classical fluids and the superposition approximation

G. H. A. COLE

Physics Department, University of Hull

Contents

	Page
1. Introduction	420
2. Microscopic specification of a simple fluid	423
2.1. Three states of matter	423
2.2. Empirical determination	424
2.3. The radial distribution and total correlation functions	425
2.4. Certain physical associations	425
3. Formulae from statistical mechanics	427
3.1. The energy function	427
3.2. Correlation functions	429
3.3. Formal link with thermodynamic functions	431
3.4. Thermodynamics and the pair correlation	433
3.5. The use of the equations	435
3.6. The virial coefficients	436
4. Equations for the pair correlation	437
4.1. Method of approach	437
4.2. First-order equations	438
4.3. The superposition approximation	440
4.4. Fisher's application of the approximation	444
4.5. A second-order equation	444
4.6. Dependence on density and temperature	445
5. Attempts to improve the closure procedure	446
5.1. Comments on functional differentiation	447
5.2. Rederivation of established equations	449
5.3. The triplet indirect correlation	450
5.4. Alternative closure approximations	453
6. Some results from the theory	454
6.1. The interparticle force potential	454
6.2. The virial coefficients	455
6.3. Liquid densities	462
6.4. Further deductions from the theory	463
6.5. The use of laboratory models	465
7. Summary and further outlook	466
References	467

Resonant scattering of electrons by molecules

J. N. BARDSLEY AND F. MANDL

Department of Theoretical Physics, University of Manchester

Contents

	Page
1. Introduction	472
I. The structure of resonances	
2. The classification of resonances in molecules	473
2.1. Shape resonances	474
2.2. Electron-excited Feshbach resonances	475
2.3. Nuclear-excited Feshbach resonances	475
3. Shape resonances	476
3.1. The 3 ev resonance of H_2^-	477
3.2. The 2 ev resonance of N_2^-	478
3.3. The 1.75 ev resonance of CO^-	479
3.4. The 1.2 ev resonance of $C_6H_6^-$	479
4. Electron-excited Feshbach resonances	480
4.1. Dissociative recombination in H_2^+	481
4.2. Dissociative recombination in NO^+	482
4.3. The 12 ev resonances of H_2^-	483
5. Nuclear-excited Feshbach resonances	484
5.1. The electronic ground state of O_2^-	484
5.2. Rydberg states of neutral molecules	484
5.3. Large molecules	485
5.4. Polar molecules	485
6. Further examples of resonances	486
6.1. The 10 ev resonance of H_2^-	486
6.2. The transmission peaks in NO and O_2	488
6.3. The 11.5 ev resonance of N_2^-	489
6.4. The low-energy resonances of $C_2H_4^-$	491
II. Collision processes	
7. Resonance formalisms	492
7.1. The theories of Siegert, and of Kapur and Peierls	492
7.2. The projection operator formalism of Feshbach	493
7.3. The configuration interaction theory of Fano	495
8. Definition of molecular resonances	497
9. The nuclear wave equation	500
9.1. Derivation of the nuclear wave equation	500
9.2. Solution of the nuclear wave equation	503
10. Dissociative attachment	504
10.1. The cross section for dissociative attachment	504
10.2. Dissociative attachment in H_2 at low energies	507
10.3. Dissociative attachment in H_2 near 10 ev	507
10.4. Dissociative attachment in hot O_2	509
10.5. Dissociative attachment in methane	510
10.6. Dissociative attachment in other molecules	511
11. Vibrational excitation	511
11.1. Theory of vibrational excitation	511

	Page
11.2. Elastic scattering	514
11.3. Vibrational excitation of H ₂ at low energies	515
11.4. Electron scattering by H ₂ near 12 ev	516
11.5. Electron scattering by N ₂ near 2 ev	519
12. Non-adiabatic collision processes	521
12.1. Vibrationally excited Rydberg states	521
12.2. Long-lived resonances in polyatomic molecules	522
13. Heavy particle collisions	523
13.1. Electron detachment in H-H ⁻ collisions	523
13.2. Associative detachment in H-H ⁻ collisions at thermal energies	524
13.3. Ionization in the collisions of two neutral atoms	526
13.4. Electronically stable resonances	527
14. Conclusions	528
References	528

Localization of electrons in condensed matter

N. H. MARCH and J. C. STODDART

Department of Physics, University of Sheffield

Contents

	Page
1. Introduction	534
2. Localization of electrons and band theory	536
2.1. Bloch functions and Wannier functions	536
2.2. Canonical or Bloch density matrix	540
2.3. Single-centre scattering	542
2.4. Defect centres in metals and semiconductors	549
2.5. Band structures in crystals	556
2.6. Disordered systems and liquids	566
3. X-ray scattering by localized distributions	573
3.1. Localized distributions and Fourier coefficients of charge density	574
4. Sommerfeld model of interacting electrons	580
4.1. High-density and low-density limits	580
4.2. Wigner transition and magnetic properties of the ground state	581
4.3. Homogeneous one-dimensional fermion system	582
5. Local potential theory and electron interactions	584
5.1. Dielectric function including exchange	586
5.2. Correlation effects	586
6. Mott transition and electron interactions in band theory	587
6.1. Theory of excitons and excitonic phases	587
6.2. Singular behaviour of dielectric constant	590
7. Localized moments and narrow-energy-band theory of ferromagnetism	591
7.1. Anderson theory of local moments	591
7.2. Qualitative effects of correlation	594
7.3. Correlations in narrow energy bands	595
7.4. Connection with Mott transition	598
7.5. Propagation of atomic excitations	599
Acknowledgments	604
Appendixes	604
Appendix 1. Self-consistent field equation for localized orbitals	604
Appendix 2. Perturbation and gradient expansion for effective potential	605
Appendix 3. Spatial dependence of orthogonality function	606
Appendix 4. Gradient expansion of overlap correction to local one-centre effective potential	608
Appendix 5. Superposition of densities	609
Appendix 6. Localized orbital in Sommerfeld model of interacting electrons (by M. I. Darby, W. Jones and N. H. March)	610
Appendix 7. Many-body form of Bloch density matrix	615
References	619

Polymer crystals

A. KELLER

H. H. Wills Physics Laboratory, University of Bristol

Contents

	Page
1. Preface: on the scope of the survey	624
2. General background	625
2.1. The significance of the random element	625
2.2. The traditional picture of crystallinity in polymers	626
2.3. Departures from the traditional model	630
3. The basic facts on chain folding in solution-grown crystals	632
3.1. The origin of the folding hypothesis	632
3.2. The factors governing crystal thickness (fold length)	633
4. The origin of chain folding: outline of theories	636
4.1. Equilibrium theories	636
4.2. Kinetic theories	637
5. The annealing process	643
5.1. Time and temperature dependence of the long-spacing increase	643
5.2. On the mechanism of the fold-length increase	644
6. Structural consequences of folding	646
6.1. On examination methods	646
6.2. Sectorization	648
6.3. On crystal habits	654
7. On characteristic polymeric features in crystal growing	656
7.1. On growing uniform crystals	656
7.2. Growth rates of crystals	657
7.3. Monomolecular crystals	658
8. The nature of the fold surface	659
8.1. On the crystallographic features	659
8.2. The concept of disordered fold surface	662
8.3. On the compatibility of evidence concerning the nature of the fold surface	674
8.4. Some new avenues in the study of the fold-surface structure	677
9. Multilayer crystals	680
9.1. Splaying layer structures	681
9.2. Cohering layers: interlamellar ties	682
9.3. Rotationally displaced terraces	683
10. Fibrous crystals: crystallization during flow	683
10.1. The origin and nature of 'shish-kebabs'	684
10.2. On the morphology and properties of the 'backbone' fibre	684
10.3. On the molecular structure, origin and implications of the fibrous crystals	685
11. Connections with the bulk melt-crystallized polymer	687
11.1. Morphology	687
11.2. On the origin of spherulites	688
11.3. Growth rates of spherulites	689
11.4. The large periods: annealing behaviour	690
11.5. Extended-chain crystals	691
11.6. Fractionation	692
11.7. Fibrous crystals	693

	Page
12. Summary of imperfection types in a crystalline polymer	696
12.1. Defects within the sublattice	696
12.2. The fold surface as a source of imperfection	697
12.3. Irregularities in the fitting of layers	697
12.4. Additional sources of disorder in melt-crystallized material	698
12.5. On the higher perfection of extended-chain-type crystals	698
Acknowledgment	698
Bibliography	699
References	699

Magnetic correlations and neutron scattering†

W. MARSHALL AND R. D. LOWDE

Atomic Energy Research Establishment, Harwell, Didcot, Berks.

Contents

	Page
1. Introduction	706
2. Formal relationships	708
2.1. The neutron-scattering cross section	708
2.2. Scattering and fluctuations	708
2.3. The wavelength-dependent susceptibility	709
2.4. Susceptibility and fluctuations	711
2.5. The power spectrum in terms of the relaxation function	711
2.6. Time-dependent susceptibilities	713
2.7. Relaxation and susceptibility	715
2.8. Relaxation of the system after a disturbance	715
2.9. Frequency-dependent susceptibility	716
2.10. Properties of the functions	717
2.11. The power spectrum and the susceptibility	718
2.12. Significance of the generalized susceptibility	718
2.13. Green functions	719
2.14. Expressions for the inelastic neutron scattering	720
3. Significance of the wavelength-dependent susceptibility	720
3.1. $\chi^{zz}(\mathbf{K})$ above T_C	720
3.2. Just below T_C ; $\chi^{zz}(\mathbf{K})$	722
3.3. Above T_C ; ferromagnet and antiferromagnet, including anisotropy	725
3.4. Below T_C ; $\chi^{xx}(\mathbf{K})$	727
3.5. The instantaneous critical correlation function	728
3.6. Computation of the critical parameters	729
3.7. Field dependence of the correlations	731
3.8. Other cases	731
4. Properties of the spectral-shape function	732
4.1. The moments of $F(\mathbf{K}, \omega)$	732
4.2. The second moment	733
4.3. High temperatures	736
4.4. Experimentally determined fluctuation spectra	740
4.5. $F(\mathbf{K}, \omega)$ at high T and large K	742
4.6. Moderately high temperatures	745
5. Spin diffusion	747
5.1. Diffusion at high temperatures	747
5.2. Diffusion at low temperatures	756
6. Critical phenomena	758
6.1. The question of critical diffusion	758
6.2. Thermodynamic slowing-down	759
6.3. The instantaneous spin- and spin-velocity-correlations at small K as a function of temperature above T_C	762
6.4. Facts and fallacies about critical scattering	763
6.5. Interpretation of the observed critical relaxation	767
7. Concluding remarks	771
References	772

† An article by the latter author which began with five lectures of the former.

Doped-crystal and gas lasers

D. W. GOODWIN AND O. S. HEAVENS

Department of Physics, University of York

Contents

	Page
1. Introduction	778
2. Laser theory	778
2.1. Elementary considerations	778
2.2. Lamb theory	781
2.3. Non-linear noise and coherence	784
2.4. Multiple axial modes	785
2.5. Relaxation oscillations	787
2.6. Giant pulse operation	788
2.7. Mode locking	792
2.8. Parametric effects in lasers	793
3. Properties of resonant cavities	794
3.1. Methods of attack	794
3.2. Diffraction treatment	795
3.3. Diffraction treatment for uniaxial anisotropic media	799
3.4. Waveguide treatment	800
3.5. Modes in systems with output coupling holes	801
3.6. Modes in systems with gain saturation	802
3.7. Unstable resonators	803
3.8. Influence of intensity-dependent anomalous dispersion	803
4. Gas lasers	804
4.1. The helium-neon system	805
4.2. Ion lasers	811
4.3. Molecular lasers	816
4.4. Other gas lasers	825
5. Raman and Brillouin lasers	825
5.1. Theory of stimulated Raman scattering	825
5.2. Raman laser materials	827
5.3. Raman shift in polar crystals	829
6. Solid state lasers	829
6.1. Energy levels in optical solids	829
6.2. Spontaneous emission in optical solids	831
6.3. Laser transitions	832
7. Losses within solid laser materials	833
7.1. Loss measurements	835
8. Doped-crystal systems	837
8.1. The trivalent rare earths	837
8.2. The divalent rare earths	841
8.3. The actinides	845
8.4. Transition ions	846
9. Energy transfer processes	848
10. Optical second-harmonic generation	849
11. Present trends	852
