REPORTS ON PROGRESS IN PHYSICS

VOLUME 32, PART 1

1969

Atmospheric electricity

C. D. STOW

Physics Department, University of Manchester Institute of Science and
Technology

Contents

	Page
1. Introduction	2
2. The electrical properties of ice	3
2.1. Thermoelectric effect	3
2.2. Electrification of melting ice	11
2.3. Electrification of snowstorms	12
2.4. Electrification of evaporating ice	13
3. The electrical properties of water	14
3.1. Electrification of freezing water	14
3.2. Electrification of fragmenting water drops during their freezing	16
3.3. Charging associated with the disintegration of water drops	17
3.4. Electrification associated with the evaporation of water	17
3.5. Electrification at the surface of water caused by splashing and the release of air bubbles	18
4. The electrification of dust, sandstorms, and volcanic plumes	20
4.1. Electrification of sand and dust.	20
4.2. Electrification of volcanic plumes	21
5. The electrification of convective clouds	22
5.1. Observations of the electrification of convective clouds.	22
5.2. Laboratory investigations of electrical processes occurring within clouds	25
5.3. Theoretical models of the growth of cloud electrification	31
6. The nature and behaviour of lightning	42
6.1. Electrical measurements of the lightning flash	43
6.2. Optical measurements of the lightning discharge.	47
6.3. The phenomenon of ball lightning	49
7. The electrical effects associated with tornadoes	50
8. Electromagnetic radiation associated with electrical processes in the atmosphere	51
8.1. Emission from colliding water drops	51
8.2. Radiation from lightning discharges	52
9. Ions and aerosols in the atmosphere	54
9.1. Ion-aerosol interactions	54
9.2. Observations of the electrode effect	55
9.3. Production of ions by point discharge	57
9.4. Radioactivity and ionization, radioactive aerosols.	57
10. The electrification of the upper atmosphere and space	58
11. The global electrical circuit	61
References	62

Cloud physics

J. LATHAM

Physics Department, University of Manchester Institute of Science and Technology

Contents

	Page
1. Introduction	70
2. Nucleation processes within clouds	71
2.1. Condensation of water vapour	72
2.2. Nucleation of the ice phase	75
3. The growth of raindrops within clouds	81
3.1. Growth of individual droplets from the vapour	81
3.2. Growth of a population of cloud droplets by condensation	82
3.3. Calculations of the collision efficiencies of cloud droplets	84
3.4. Experimental studies of the collision and coalescence of cloud droplets	90
3.5. Growth of populations of cloud droplets by collision and coalescence	97
3.6. Disintegration of raindrops	100
4. The growth of ice particles within clouds	105
4.1. Growth of ice crystals from the vapour	105
4.2. Habit of ice crystals grown from the vapour	107
4.3. Mechanism of habit change	110
4.4. Aggregation of ice crystals to form snowflakes	113
4.5. Growth of graupel and hail by the accretion of supercooled droplets	117
4.6. Microphysics of the accretion process	122
4.7. Formation and multiplication of ice crystals within clouds at temperatures close to 0 °C	125
Acknowledgments	128
References	128

The evolution of the solar system

M. M. WOOLFSON

Physics Department, University of York

Contents

	Page
1. A general description of the solar system	136
1.1. The planetary orbits	136
1.2. Distribution of matter and of angular momentum	137
1.3. The satellite systems	140
1.4. Chemical composition	140
2. What should a theory explain?	141
3. A review of theories up to 1960	142
3.1. General remarks	142
3.2. Nebula theories	143
3.3. Two-body interaction theories	144
3.4. Theories involving magnetic or electric fields	147
3.5. Cataclysmic theories	148
3.6. New-nebula theories	148
3.7. Accretion theories	149
3.8. Concluding comments	149
4. The Hoyle nebula theory	149
4.1. Magnetic transfer of angular momentum	149
4.2. Evolution of the nebula	152
4.3. Formation of the disk from mechanical considerations	153
4.4. Evolution of the disk with magnetic forces	154
4.5. Conductivity of the planetary gas	155
4.6. Dissipation of energy	155
4.7. Condensation of the planets	156
5. The accretion theory	157
5.1. General features of the theory	157
5.2. Capture of material	159
5.3. Absorption of material by the Sun	160
5.4. Aggregation of material to form planets	160
6. McCrea's floccule theory	162
6.1. Outline of the process	162
6.2. Selection of parameters for the model	163
6.3. Further deductions	164
6.4. Time for formation of the central condensation	166
6.5. Formation of planets	166
6.6. General comments	167
7. The capture theory	167
7.1. Basic ideas	167
7.2. A simple model of the interaction of two stars	167
7.3. Capture of material	170
7.4. Examination of a more detailed model.	171
7.5. Condensation of planets	174
7.6. General remarks	176
8. Some recent work related to chemical evidence.	176
8.1. Introduction	176
8.2. Chemical evidence	176
8.3. Urey's nebula theory	180
8.4. General remarks	181
9. Can we ever know?	182
References	184

Some conformation problems for long macromolecules

P.-G. DE GENNES

Service de Physique des Solides,† University of Paris

Contents

	Page
1. The analogy between a chain and a particle trajectory	187
2. Excluded volume problems	190
2.1. A single chain in solution	190
2.2. Amphiphilic copolymers	193
3. Adsorption of flexible chains	195
3.1. Data on the thickness of the adsorbed layer	195
3.2. Weakly adsorbed chains	197
4. Denaturation of nucleic acids	200
4.1. Experimental background	200
4.2. Simplified model for natural DNA	201
4.3. Synthetic nucleic acids	203
5. Concluding remarks	204
Acknowledgments	204
References	204

Laser light scattering in laboratory plasmas

D. E. EVANS AND J. KATZENSTEIN

Culham Laboratory, Abingdon, Berks.

Contents

	Page
1. Introduction	207
2. Outline of the theory	209
2.1. Introduction	209
2.2. Formulation of the scattering problem	210
2.3. Calculation of the electron density fluctuation	216
2.4. The scattering cross-section: Salpeter approximation	220
2.5. Case of $T_e/T_i > 1$: scattering from ion-acoustic waves	225
2.6. Effect of relative drift velocity between electrons and ions	226
2.7. Effect of uniform, stationary magnetic field	228
2.8. Effect of Coulomb collisions	230
3. Experimental considerations	232
3.1. Light source	232
3.2. Plasma and laser pulses of comparable duration	232
3.3. Plasma pulse much longer than laser pulse	234
3.4. Effects of the laser on the plasma	235
3.5. Stray light	237
3.6. Dispersing instruments	242
4. Experiments and results	245
4.1. The scattering domains	245
4.2. Early experiments	247
4.3. Experiments in the Thomson ($\alpha \ll 1$) domain	250
4.4. Collective scattering: electron term	254
4.5. Collective scattering: ion term	258
References	269

The present status of C, P and T invariance

E. G. P. ROWE AND E. J. SQUIRES

Department of Mathematics, University of Durham

Contents

	Page
1. Theory and methods	274
1.1. Historical introduction	274
1.2. A classical model	274
1.3. Symmetry in quantum mechanics	275
1.4. Space reflection	277
1.5. Charge conjugation	280
1.6. Time reversal	283
1.7. CPT	289
Appendix to Section 1	291
2. Strong interactions	294
2.1. Strong, electromagnetic, and weak interactions	294
2.2. Evidence for parity invariance in strong interactions	294
2.3. Intrinsic parities of strongly interacting particles	297
2.4. Evidence for charge-conjugation invariance in strong interactions	298
2.5. Evidence for T in strong interactions	300
3. Electromagnetic interactions	302
3.1. Invariance under parity	302
3.2. C and T invariance in electromagnetism	302
3.3. Evidence for CPT invariance	306
4. Weak interactions	307
4.1. Introduction	307
4.2. Weak interaction theory	307
4.3. π_{12} decay	308
4.4. Muon decay	309
4.5. Neutron decay	309
4.6. Non-leptonic hyperon decay	311
4.7. K_{13}^{\pm} decays	312
4.8. Summary	313
5. The 'superweak' interaction	314
5.1. The K^0, \bar{K}^0 system	314
5.2. Properties of K_L and K_S	316
5.3. CP violation in the K^0, \bar{K}^0 system	317
5.4. Explanations of the $K_L \rightarrow 2\pi$ mode which preserve CP	322
5.5. Possible forms of CP non-conserving forces	323
5.6. Tests for CPT and T invariance	326
6. Conclusion	327
References	327

The theory of elastic scattering of neutrons by magnetic salts

S. W. LOVESEY AND D. E. RIMMER

Atomic Energy Research Establishment, Harwell, Didcot, Berks.

Contents

	Page
1. Introduction	334
2. Fundamental theory	336
2.1. Cross-section formula	336
2.2. Bragg condition	337
2.3. Polarization dependence of the cross section	339
2.4. Nuclear interaction potential	341
2.5. Magnetic interaction potential	341
2.6. Spin-only scattering	344
3. Small $ \kappa $ approximation for magnetic scattering	345
4. Tensor operator approach	346
4.1. The need for a new formalism	346
4.2. Summary of properties of irreducible tensor operators	347
4.3. Structure of the cross-section expression	350
4.4. The neutron spin factor \mathcal{A}	352
4.5. The crystal factor \mathcal{B}	358
5. Matrix elements of the magnetic interaction operator	361
6. Dipole approximation	369
6.1. Dipole approximation for an isolated ion	370
6.2. Dipole approximation for the general case	373
7. Full discussion of the general formulae	374
7.1. General structure of the formulae	375
7.2. Algebraic structure of the formulae	379
8. Examples	382
8.1. Terbium, Tb^{3+}	383
8.2. Cobalt, Co^{2+}	385
8.3. Uranium, U^{4+}	388
9. Summary of formulae	388
10. Conclusions	391
Appendix (notation)	391
References	393
